## PREFACE

This volume of SOLUBILITIES completes the fourth revision of the tables of Inorganic and Metal-Organic Compounds. Volume I, published several years ago, includes compounds whose formulas fall alphabetically from A through I. The present Volume, II, covers the solubilities of compounds from K through Z.

In compiling this volume, the systematic search of the literature was extended through the early sixties and thus included several hundred additional references not available at the time of publication of Volume I. The general plan of the tables is alphabetical by elements, both for single compounds and for multicomponent systems. For each compound the solubility in water is followed, in order, by the solubilities in acids, bases, salts, aqueous solvents, anhydrous solvents, and fused salts.

Volume II contains a complete Subject Index and Author Index to all compounds listed in *both* Volumes I and II. Locating data is thereby facilitated, and the systematic arrangement of the tables often allows related results to be found nearby.

The compilation has required accumulating and evaluating the results of a great many investigators. Data which are clearly in error have been omitted, but when there is no clear choice between conflicting results, both sets of data have been included in the tables. When a number of authors have been found to be in substantial agreement, composite tables have been constructed. In addition, much data have been plotted in order to read the average points from a smooth curve.

Dr. Atherton Seidell, through whose efforts three previous editions of this work were completed, passed away before publication of this volume. His dedication to the task of organizing and disseminating technical information has pointed the way toward continuing this series.

### SOLUBILITY IN LIQUID AMMONIA (Johnston and Meyer, 1949)

Birch and MacDonald, 1947 found the eutectic to occur at  $-157^{\circ}$ . The older data of Ruff and Geisel, 1906 are given in parentheses.

$t^{\circ}$	Gms. K per 100 gms. $\text{NH}_3$	
-100	---	(47.7)
- 50.38	45.56	(48.0)
- 33.5	46.38	
0	49.05	(48.5)

### THE SYSTEM POTASSIUM - POTASSIUM IODIDE - AMMONIA (liq.) AT $-31^{\circ}$ (Cubiceioti, 1949)

Two liquid layers are formed and K and KI are miscible in all proportions only when the mole fraction of  $\text{NH}_3$  is greater than 0.95.

Data for the solubility of potassium and sodium - potassium alloys in ethers (diethylene glycol, tetrahydrofuran, dimethyl ether, cyclic propylene oxide tetramer) are given by Down, Lewis, Moore and Wilkinson, 1957. Blue solutions are obtained.

### SOLUBILITY IN MOLTEN KOH (von Hevesy, 1909)

Difficulty was experienced due to the failure of the excess of K to separate completely from the saturated solution. Time of heating, 50 hours.

$t^{\circ}$	Gms. K per 100 Gms. KOH
480	7.8-8.9
600	3 -4
650	2 -2.7
700	0.5-1.3

A study of the reactions  $\text{KOH} + \text{Na} \rightleftharpoons \text{NaOH} + \text{K}$  at  $550^{\circ}$  was made by Klyashtorny, 1957. Equilibrium was attained within 15 minutes.

# K KALIUM

## SOLUBILITY IN SALTS

The melting point diagrams of these systems generally show a low solubility of metallic potassium in the liquid (~1 mole %), and a region of liquid immiscibility.

K+KBr (Johnson and Bredig, 1958; Rogener, 1937)

K+KCl ( " " " " ; Cubicciotti, 1949)

K+KF ( " " " " ; Bredig, Bronstein, and Smith, Jr., 1955)

K+KI ( " " " " )

Data for the solubility of potassium in solid halides is given by Mollwo, 1933.

Rinck, 1932 studied the reactions  $K + NaF \rightleftharpoons KF + Na$ ,  $K + NaCl \rightleftharpoons KCl + Na$ ,  $K + NaBr \rightleftharpoons KBr + Na$ , and  $K + NaI \rightleftharpoons KI + Na$  at 900° and  $K + NaOH \rightleftharpoons KOH + Na$  at 800°. Klyashtorny, 1957 studied the reaction  $K + NaCl \rightleftharpoons KCl + Na$  at 550°.

## AlO POTASSIUM ALUMINATE $K_2O \cdot Al_2O_3 \cdot 3H_2O$

THE SYSTEM POTASSIUM HYDROXIDE - ALUMINUM HYDROXIDE - WATER AT 30°  
(Jucaitis, 1934)

The mixtures were shaken for 3 months.

Gms. per 100 gms. sat. sol.		Solid Phase	Gms. per 100 gms. sat. sol.		Solid Phase

## AsO POTASSIUM MONOHYDROGEN ARSENATE $K_2HASO_4$

### THE SYSTEM POTASSIUM MONOHYDROGEN ARSENATE - WATER (Duc-Maugé, 1957a)

The results are presented graphically. Except for the invariant points, the following data were read from the author's curves. Compositions are expressed in terms of the anhydrous formula  $K_4As_2O_7$ , although this phase was not encountered.

POTASSIUM DIHYDROGEN ARSENATE  $KH_2AsO_4$ 

AsO

THE SYSTEM POTASSIUM DIHYDROGEN ARSENATE - WATER  
(Duc-Maugé, 1957a; Paul, Lal, Gaiind, and Bawa, 1953)

The earlier results (Paul, et.al.) indicate a transition from monohydrate to anhydrous salt at 59.6°. Duc-Maugé points out that the shape of the intersection of the curves at the transition seems to violate the laws of thermodynamics. Only the anhydrous salt was found in the later work.

POTASSIUM penta BORATE  $K_2O \cdot 5B_2O_3$ 

SOLUBILITY OF POTASSIUM PENTABORATE IN WATER  
(Bollet and Andres, 1930)

The pentaborate was prepared by the action of boric acid upon potassium chloride and upon potassium nitrate at temperatures above  $100^\circ$  in presence of water vapor. The anhydrous salt hydrates easily in moist air.

# K KALIUM

The authors also found that at about 170° the solid phase is transformed to  $K_2O \cdot 5B_2O_3 \cdot 2H_2O$  and above 350° it becomes the anhydrous compound—which melts at 780°.

The values in parentheses are by Menzel, 1927.

## POTASSIUM SODIUM AMMONIUM BORATES

80

Data on the composition of solutions prepared by shaking mixtures of sodium, potassium and ammonium di and pentaborates with added boric acid and/or ammonia in water are given by Rothbaum, Todd, and Walker, 1956. pH and densities were also determined, and compositions leading to maximum solubility are given.

EQUILIBRIUM IN THE SYSTEM BORON OXIDE, POTASSIUM OXIDE  
DETERMINED BY THERMAL ANALYSIS  
(Rollet, 1935)

Considerable difficulty was experienced on account of the slowness of crystallization and tendency of the mixtures to form glass.

Data for the systems K<sub>2</sub>O + B<sub>2</sub>O<sub>3</sub> + KCl and K<sub>2</sub>O + B<sub>2</sub>O<sub>3</sub> + KBr are given by Stahlhane, 1930.

Melting point data are given for the following systems:

(1) van Klooster, 1910-11 (2) Kislova, Posypaiko and Bergman, 1955 (3) Posypaiko, Bergman and Kislova, 1956 (4) Bergman, Kislova and Posypaiko, 1955 (5) Bergman, Kislova and Posypaiko, 1955a (6) Bergman and Bartbaronov, 1957b (7) Bergman, Kislova and Posypaiko, 1953 (8) Bergman and Bartbaronov, 1957 (9) Bergman and Bartbaronov, 1957a (10) Bergman and Nikonova, 1942.

## K KALIUM

## Br POTASSIUM BROMIDE KBr

## SOLUBILITY IN WATER

The results of most investigators are in good agreement. The values below are averages of the data of Meusser, 1905; Etard, 1884; de Coppet, 1883; Tilden and Shenstone, 1884; Hering, 1936; Flottmann, 1928; Scott and Durham, 1930; Scott and Frazier, 1927; Bronstead, 1933; Klein and Svanberg, 1920; Rodebush, 1918; Joseph, 1920; Larson and Hunt, 1939; Guerassimow, 1934; Ricci, 1934; Fock, 1897; Bogoyavlenskii, 1949; Mikimov, Kapkaeva and Bergman, 1952. The results of Bergman and Vlassov (1942, 1949) are up to 1% lower than these below 20°. An  $\alpha \rightarrow \beta$  transition occurs at 20-22° (B. and V.). Most of the results above 100° were determined by the synthetic method by Benrath, Gjedebo, Schiffers, and Wunderlich, 1937. For references to the solubility of KBr near the critical temperature see Booth and Bidwell, 1948 and Schroer, 1927.

SOLUBILITY OF POTASSIUM BROMIDE IN WATER AND DEUTERIUM OXIDE  
(Eddy and Menzies, 1940)

Small closed vessels containing about one gram of solvent were used, and the D<sub>2</sub>O had a purity of 99.4%, determined from its freezing point. Including corrections for the volume of water in the vapor phase, the authors estimate the accuracy of each determination at 1%. The experimental results were plotted, and the authors read the following rounded values from the curve. The original data are given as moles of salt per 55.51 moles of solvent.

## SOLUBILITY OF POTASSIUM BROMIDE IN AMMONIA SOLUTIONS

(Distanov and Kiselev, 1953)

Solubilities in the system KBr-NH<sub>3</sub>-H<sub>2</sub>O were determined from -74° to +135°. Small amounts of NH<sub>3</sub> decrease the solubility of KBr, but above 13-16 wt. % NH<sub>3</sub>, the solubility increases. KBr can be separated from NaCl by utilizing the differences in their solubilities in NH<sub>3</sub>-H<sub>2</sub>O mixtures.

# THE SYSTEM POTASSIUM BROMIDE - POTASSIUM CHLORIDE - WATER

The continuous solid solutions in this system have been studied many times, with good agreement among the various data. The solid solutions are of Roozeboom Type II. Additional results are given by most of the authors listed, and also by Touren (1900), Etard (1897), Fock (1897), Amadori and Pampanini (1911) at 25°.

Results from 200°-650°, up to 350 atm. pressure, are given by Ravich and Borovaya, 1949. See also Schlesinger and Zorkin, 1939.

The system  $\text{KBr} + \text{KCl} + \text{HBr} + \text{H}_2\text{O}$  was studied by Petrov and Ilin, 1939 by adding conc.  $\text{HBr}$  to solutions of  $\text{KBr} + \text{KCl}$ , and by isothermal evaporations.

The compositions of several saturated solutions in the system  $\text{KBr} + \text{KCl} + \text{HI} + \text{H}_2\text{O}$  at  $25^\circ$  are also given by Zhdanov, 1948.

THE SYSTEM POTASSIUM BROMIDE - AMMONIUM BROMIDE - WATER AT 25°  
(Fock, 1897; Flatt and Burkhardt, 1944)

Two series of solid solutions are formed.

The data are in fairly good agreement. Flatt and Burkhardt found more  $\text{NH}_4\text{Br}$  (75.7 mol. %) at the invariant point than did Fock (70.27%).

(\*) Denotes the invariant solutions.

THE SYSTEM POTASSIUM BROMIDE - SODIUM BROMIDE - WATER  
(Vlassov and Bergman, 1943; Bergman and Vlassov, 1949)

The system was studied from the eutectic ( $-32^\circ$ ) to  $50^\circ$ , and the transition temperatures for  $\alpha\text{KBr} \rightleftharpoons \beta\text{KBr}$  were determined as a function of the amount of sodium bromide in solution.

Results in good agreement with the following are given by Mukimov and Kapkaeva, 1952.

THE SYSTEM POTASSIUM BROMIDE - TERTIARY BUTYL ALCOHOL - WATER AT 30°  
(Ginnings and Robbins, 1930)

Br

The points on the binodal curve of this system were determined by observing the appearance or disappearance of clouding in a mixture of weighed amounts of KBr and one of the liquids, upon addition of a weighed amount of the other. Conjugated points were found by determination of KBr in two liquid phases in contact with each other and from these the plait point (p.p.) was obtained by plotting.

Gms. per 100 gms. mixture		Gms. per 100 gms. mixture		Gms. per 100 gms. mixture		Gms. per 100 gms. mixture	
(CH <sub>3</sub> ) <sub>3</sub> COH	KBr	(CH <sub>3</sub> ) <sub>3</sub> COH	KBr	(CH <sub>3</sub> ) <sub>3</sub> COH	KBr	(CH <sub>3</sub> ) <sub>3</sub> COH	KBr

56.9	5.4	35.7	10.0	17.0	17.0	6.8	30.4
53.4	6.1	29.7	11.9	13.4	19.8	6.1	33.1

Results at 25°

Ginnings, Herring and Webb, 1933 found the plait point of the system to be: 11.5% KBr, 35.1% (CH<sub>3</sub>)<sub>3</sub>COH, 53.4% H<sub>2</sub>O.

The original results for the remaining points of the binodal curve are not given but only the values of a series of arbitrary constants calculated from them by means of empirical equations.

THE SYSTEM POTASSIUM BROMIDE - ETHYLENE GLYCOL - WATER AT 30°

## SOLUBILITY OF POTASSIUM BROMIDE IN AQUEOUS SOLUTIONS OF DIOXANE AT 25° (Herz and Lorentz, 1929)

Two liquid layers are formed between 47 and 85 vol. percent Dioxane. The lower contains 2.1 gm. mol. KBr per liter and the upper 0.03 gm. mol. per liter.

cc. Dioxane per 100 cc. solvent	Gm. Mol. KBr per liter sat. sol.	Gms. KBr per liter sat. solution
10	4.20	500
20	3.70	440
30	2.90	345

THE SYSTEM POTASSIUM BROMIDE - UREA - WATER  
(Bokhovkin and Bokhovkina, 1949)

Results are given from the eutectic to 26°. The eutectic solution contains 24.3% KBr, 24.6% Urea, and freezes at -20.8° in equilibrium with ice,  $\alpha$ -KBr, and  $\gamma$ -urea. The data are presented as the freezing points of solutions of urea + water with small additions of KBr, and KBr + water with additions of urea.

The figure shows the area of saturation with the various phases at several temperatures. Numerical data for solutions saturated with ice are also given in the original.

SOLUBILITY OF POTASSIUM BROMIDE IN AQUEOUS SOLUTIONS OF URETHAN AT 25°  
(Palitzsch, 1928, 1929)

The reactions below the melting points were studied by Link and Wood, 1940 for the following salt pairs:

POTASSIUM IODO DIBROMIDE KIBr<sub>2</sub>

Br

DATA OF CREMER AND DUNCAN, 1931

In H<sub>2</sub>O One gm. H<sub>2</sub>O dissolves 10-12 gms. KIBr<sub>2</sub>, at 18°.

In CCl<sub>4</sub> At 25°, one liter of saturated solution of potassium iodo dibromide in carbon tetrachloride contains 0.0473 gm. atoms of Halogen produced by the dissociation of the compound into KBr and IBr.

POTASSIUM TIN BROMIDES KSnBr<sub>3</sub>, K<sub>4</sub>SnBr<sub>4</sub>

SOLUBILITY OF MONO POTASSIUM STANNO BROMIDE IN WATER  
(Rimbach and Fleck, 1916)

t°	Gms. per 100 gms. sat. sol.					Solid Phase
	Br	+	Sn	+	K = SnBr <sub>3</sub> K	
0.2*	11.21		3.88		2.94	KSnBr <sub>3</sub> ·H <sub>2</sub> O + SnBr <sub>3</sub> ·H <sub>2</sub> O
17.1*	16.17		6.05		3.94	" "
36.3*	24.56		10.84		4.90	" "
46.3	30.83		15.22		5.09	KSnBr <sub>3</sub> ·H <sub>2</sub> O
74.6	40.88		20.24		6.70	"
					67.82	

\*At these temperatures the atomic ratios of the constituents in solution do not correspond to the double compound, hence the solid phase is not a single substance.

# K KALIUM

## SOLUBILITY OF TETRA POTASSIUM STANNO BROMIDE IN WATER (Rimbach and Fleck, 1916)

t°	Gms. per 100 gms. sat. sol.			Solid Phase
	Br	Sn	K	
0.3*	19.26	1.00	8.77	$K_4SnBr_4 \cdot H_2O + SnBr_3 \cdot H_2O$
16.4*	28.62	2.33	12.48	" "

62.1*	39.43	8.44	13.75	" "
77.1*	43.76	12.73	13.03	" "

\*At these temperatures the atomic ratios of the constituents in solution do not correspond to the double compound, hence the solid phase is not a single substance.

## BrO POTASSIUM BROMATE $KBrO_3$

### SOLUBILITY IN WATER

The various results are in good agreement. The data below 100° are those of Ricci (1934) and Guerassimow (1934). The data of Kremens (1856), Rammelsberg (1842), Pohl (1851), Rothmund (1910), Geffcken (1904), Swensor and Ricci (1930), and Ricci and Offenbach (1951) are similar. The values from 134° to 312° were determined by Benrath, Gjedebo, Schiffers and Wunderlich (1937) by the synthetic method. The salt is anhydrous at all temperatures.

## POTASSIUM ACID FORMATE HCOOK·HCOOH

## SOLUBILITY IN WATER

(Groschuff, 1903)

t°	0	25	50	80
Gms. HCOOK per 100 gms. sat. sol.	60.4	69.8	79.2	90.7

## K KALIUM

Since the acid salt is less soluble at ordinary temperatures than the neutral salt, it can be precipitated from the solution of the neutral salt by addition of aqueous formic acid. Proceeding in this way an impure product is obtained, giving solubility values (expressed in HCOOK) as shown below:

t°	Gms. HCOOK per 100 Gms. Solution	Moles HCOOH per 1 mole HCOOK	t°	Gms. HCOOK per 100 Gms. Solution	Moles HCOOH per 1 mole HCOOK
0	36.3	3.21	60	44.0	2.33
19.5	38.2	2.96	70	45.9	2.16
39.3	40.8	2.65	90	52.1	1.68

Freezing-point data for the system HCOOK + HCOOH are given by Kendall and Adler, 1921.

SOLUBILITY OF POTASSIUM ACETATE IN ACETIC ACID, DETERMINED  
BY THE FREEZING-POINT METHOD

The results of Davidson and McAllister (1930) and Bakunin and Vitale, 1935 are in considerable disagreement.

1:2 =  $\text{CH}_3\text{COOK} \cdot 2\text{CH}_3\text{COOH}$ ; 1:1 =  $\text{CH}_3\text{COOK} \cdot \text{CH}_3\text{COOH}$ ; 2:1 =  $2\text{CH}_3\text{COOK} \cdot \text{CH}_3\text{COOH}$

(Davidson and McAllister, 1930)

 $\text{CH}_3\text{COOK} \cdot \text{CH}_3\text{OH}$ .

## K KALIUM

Melting point data are given for:

$\text{CH}_3\text{COOK} + \text{CH}_3\text{COONa}$  Baskof, 1915, 1917  
 $\text{CH}_3\text{COOK} + (\text{CH}_3\text{COO})_2\text{Pb}$  Lehrman and Leifer, 1938  
 $\text{CH}_3\text{COOK} + \text{LiNO}_3 \rightleftharpoons \text{CH}_3\text{COOLi} + \text{KNO}_3$  Diogenov, Nurminskii and Gimelshtein, 1957

### POTASSIUM TRIFLUORO ACETATE $\text{CF}_3\text{COOK}$

At 29.8°, 50.13 gms.  $\text{CH}_3\text{COOK}$  dissolve in 100 gms.  $\text{CF}_3\text{COOH}$ . The solid phase is  $\text{CF}_3\text{COOK} \cdot \text{CF}_3\text{COOH}$ . (Hara and Cady, 1954)

### CH POTASSIUM PROPIONATE $\text{C}_2\text{H}_5\text{COOK} \cdot \text{H}_2\text{O}$

100 gms. methyl alcohol ( $\text{CH}_3\text{OH}$ ) dissolve 39.0 gms. anhydrous potassium propionate at 15° and 55.33 gms. at 71.3° (= b. pt. of sat. sol.). (Henstock, 1934)

### POTASSIUM LACTATE $\text{CH}_3\text{CHONCOOK}$

#### FREEZING POINTS OF POTASSIUM LACTATE SOLUTIONS (Dietz, Degering, and Schopmeyer, 1941)

Gms. Potassium Lactate per 100 gms. Sat. Sol.	t°	Gms. Potassium Lactate per 100 gms. Sat. Sol.	t°
5	-1.6	30	-16.1
10	-3.7	40	-28.1
20	-8.6	50	-51.0

The density, refractive index, viscosity, boiling points and surface tension of various potassium lactate solutions are also reported.

### CH POTASSIUM *n*-BUTYRATE $\text{C}_3\text{H}_7\text{COOK}$

100 gms. water dissolve 296.8 gms.  $\text{C}_3\text{H}_7\text{COOK}$ , or 100 gms. sat. solution contain 74.8 gms. at 31.25°.

100 gms. of an aq. solution saturated with sugar and  $\text{C}_3\text{H}_7\text{COOK}$  contain 49.19 gms. sugar + 34.78 gms.  $\text{C}_3\text{H}_7\text{COOK}$  + 16.03 gms.  $\text{H}_2\text{O}$  at 31.25°. (Köhler, 1897)

100 gms. methyl alcohol ( $\text{CH}_3\text{OH}$ ) dissolve 51.04 gms. *n* potassium butyrate,  $\text{CH}_3\text{CH}_2\text{CH}_2\text{COOK}$ , at 15° and 120.84 gms. at 70.9° (= b. pt. sat. sol.). (Henstock, 1934.)

### POTASSIUM *iso*-BUTYRATE $(\text{CH}_3)_2\text{CHCOOK}$

#### EQUILIBRIUM IN THE SYSTEM POTASSIUM *iso*-BUTYRATE, *iso*-BUTYRIC ACID AND WATER AT 25° (Bury and Mends, 1939)

Suitable mixtures were shaken in hard glass vessels until analysis showed that equilibrium was established. *iso* butyric acid was determined by titration and potassium *iso* butyrate by conversion into potassium

chloride. The two liquid layers which were formed in all cases had the following compositions.

Upper Layer Gms. per 100 gms. sat. sol.		Lower Layer Gms. per 100 gms. sat. sol.		Upper Layer Gms. per 100 gms. sat. sol.		Lower Layer Gms. per 100 gms. sat. sol.

## SOLUBILITY OF POTASSIUM ACID TARTRATE IN AQUEOUS ETHANOL (For additional data from 5° to 25° see Ivanov, 1947)

### Results at 14° (Pierrat, 1921)

Saturation was obtained by agitating the mixtures for several hours. The sat. solution was evaporated to dryness in a current of air and the residue dissolved in enough water to yield the original volume of the solution. The tartrate in this was determined by electrolytic conductivity.

	Wt. per cent C <sub>2</sub> H <sub>5</sub> OH in solvent	Gms. KHC <sub>4</sub> H <sub>4</sub> O <sub>6</sub> per 100 cc. sat. sol.	Wt. per cent C <sub>2</sub> H <sub>5</sub> OH in solvent	Gms. KHC <sub>4</sub> H <sub>4</sub> O <sub>6</sub> per 100 cc. sat. sol.

	15.9	1.5	94.7	0.05
	27.3	0.77		

### Results at 18° (Paul, 1927, 1926)

The figures in parentheses show the  $\frac{d_t}{t}$  of the saturated solutions.

The author also gives data for the pH and the electrolytic conductivity of the saturated solutions.

POTASSIUM URATE KHC<sub>5</sub>H<sub>4</sub>N<sub>4</sub>O<sub>3</sub>

SOLUBILITY OF POTASSIUM URATE IN WATER  
(Barkan, 1924)

It was previously shown that sodium urate passes from a gelatin like colloidal form to a stable granular condition, and the author desired to learn if the potassium salt behaves likewise. Several different samples of potassium urate were prepared and used for solubility determinations. The solubility of each diminished with time of rotation. In general the diminution was from about 2.38 gms. per liter to 1.9 gms. per liter. The mean of all the determinations was:

2.13 gms. (=  $10.35 \times 10^{-3}$  gms. mols.) potassium urate per liter at 18°.

Several determinations of the solubility of the compound in the fresh colloidal form gave, as the highest value, 6.67 gms. (=  $32.4 \cdot 10^{-3}$  gm. mols.) potassium urate per liter at 18°.

POTASSIUM CITRATE (CH<sub>2</sub>)<sub>2</sub>C(OH)(COOK)<sub>3</sub>·H<sub>2</sub>O

CH

SOLUBILITY IN WATER  
(Average results of Seidell, 1910; Greenish and Smith, 1901; Köhler, 1897)

25	64.5	182 (d <sub>25</sub> = 1.518)
30	66.0	194

100 gms. H<sub>2</sub>O dissolve 198.3 gms. (CH<sub>2</sub>)<sub>2</sub>COH(COOK)<sub>3</sub> + 303.9 gms. cane sugar at 31.25°. (Köhler, 1897.)

# K KALIUM

## SOLUBILITY OF POTASSIUM CITRATE IN AQUEOUS ETHYL ALCOHOL AT 25° (Seidell, 1910)

When potassium citrate is added to aqueous alcohol of certain concentrations the mixture separates into two liquid layers. A series of determinations made by adding an excess of the salt to 10-15 cc. portions of several aq. alcohol mixtures at 25° gave the following results.

	Wt. % C <sub>2</sub> H <sub>5</sub> OH in Solvent		$d_{25}$ of Sat. Solution	Wt. % C <sub>2</sub> H <sub>5</sub> OH in sat. Solution	Gms. (CH <sub>2</sub> ) <sub>2</sub> COH(COOK)·H <sub>2</sub> O per 100 Gms. Sat. Solution
CH	8.9	{ a	--	--	--
		{ b	1.4920	0	60.0
	32	{ a	--	--	0.2
		{ b	1.4930	0	61.6
	51	{ a	--	65.1	0.38
		{ b	--	--	62.5
	70.2	{ a	0.8366	81.0	0.10
		{ b	--	--	62.3
	81.4		0.8356	81.4	0.038
	91.6		0.8139	91.6	0.016
	99.9		0.7896	99.5	0.014

a = upper, alcohol rich layer.

b = lower, water rich layer.

A series of determinations was also made by adding just enough potassium citrate to the alcohol solution to cause distinct clouding and then, after bringing to 25°, titrating with the aqueous alcohol mixture to disappearance of the clouding. The results were plotted and the following interpolated values obtained.

Wt. % C <sub>2</sub> H <sub>5</sub> OH in Solvent	$d_{25}$ of Sat. Solution	Gms. (CH <sub>2</sub> ) <sub>2</sub> COH(COOK) <sub>3</sub> ·H <sub>2</sub> O per 100 Gms. Sat. Sol.
0	1.518	64.5
5	1.400	52.5
10	1.310	45.5
20	1.177	31.5
30	1.085	21.5
40	1.005	12.4
50	0.943	5.6
60	0.900	1.6
70	0.868	0.4
80	0.838	0.04

In one determination at 15°, made with alcohol of 59 vol. per cent, 4.51 gms. (CH<sub>2</sub>)<sub>2</sub>COH(COOK)<sub>3</sub>·H<sub>2</sub>O were required to just cause clouding.

100 gms. U.S.P. Glycerol (CH<sub>2</sub>OHCHOHCH<sub>2</sub>OH) saturated with Potassium Citrate contain 28.2 gms. (CH<sub>2</sub>)<sub>2</sub>C(OH)(COOK)<sub>3</sub>·H<sub>2</sub>O at 25°. (Schnellbach and Rosin, 1931.)

SOLUBILITY OF POTASSIUM PICRATE IN AQUEOUS SOLUTIONS OF  
ETHYL ALCOHOL, METHYL ALCOHOL AND OF ACETONE AT 25°  
(Fischer, 1914, 1918)

The composition of the aqueous alcohol and acetone mixtures, which served as solvents was accurately controlled by density determinations. Saturation was secured by constant agitation in a thermostat. The saturated solution was withdrawn by means of a graduated pipet and its dissolved picrate determined by evaporation and weighing the residue, or by a method of titration. The absolute alcohol was prepared by treatment with lime and distillation.

## K KALIUM

POTASSIUM HELIANTHATE  $KC_{14}H_{14}N_3SO_3 \cdot 2H_2O$ 

1000 cc.  $H_2O$  dissolve 4.368 gms.  $KC_{14}H_{14}N_3SO_3 \cdot 2H_2O$  at 20-25°. (Stark and Dehn, 1918.)

## POTASSIUM Salts of PHENOLPHTHALEIN

CH

EQUILIBRIUM IN THE SYSTEM POTASSIUM HYDROXIDE, PHENOLPHTHALEIN  
AND WATER AT 25°  
(Bassett and Bagnall, 1924)

Note.—Saturation was obtained by constant rotation for not less than 3 days of mixtures of phenolphthalein and aqueous potassium hydroxide solutions of various strengths. Such concentrations were chosen that a liquid and a solid phase was obtained in all cases. Both the saturated solution and the solid phase was analyzed. No solid colored salt was obtained. The results are expressed in terms of phenolphthalein anhydride ( $C_{20}H_{12}O_3$ ) potassium oxide ( $K_2O$ ) and water.

# POTASSIUM METHYL ORANGE $(\text{CH}_3)_2\text{NC}_6\text{H}_4\text{N}_2\text{C}_6\text{H}_4\text{SO}_3\text{K}$

The phase diagram for the system potassium methyl orange - water in which liquid crystals are formed is given by Branner, 1939.

# POTASSIUM LAURATE $\text{CH}_3(\text{CH}_2)_{10}\text{COOK}$

CH

100 gms. Water dissolve approx. 70.0 gms.  $\text{CH}_3(\text{CH}_2)_{10}\text{COOK}$  at  $25^\circ$ .  
 " " Benzene " " 0.005 " " "

Results are also given for the extraction of lauric acid from aqueous solutions of potassium laurate and of sodium laurate by means of benzene. (McBain and Eaton, 1928.)

The phase rule diagrams for equilibrium in the system potassium laurate + lauric acid + water, at temperatures between  $100^\circ$  and  $370^\circ$  are given by McBain and Field, 1933. Due to high viscosity, even at  $90^\circ$ , months may be required for the separation of the liquid phases. The existence of acid soaps is demonstrated by the separation of crystalline sediments from dilute solutions of soluble soap such as potassium laurate. At  $370^\circ$  the three components are almost but not quite soluble in all proportions.

## THE SYSTEMS K LAURATE - KCl - $\text{H}_2\text{O}$ AND K LAURATE - $\text{K}_2\text{CO}_3$ - $\text{H}_2\text{O}$ AT $23^\circ$ (Dervichian, Joly and Titchen, 1952)

250 equilibrium determinations were made in the  $\text{K}_2\text{CO}_3$  system and 200 in the KCl system. The results are presented in the following diagrams.

The solubility of potassium laurate in solutions containing up to 35% potassium silicate ( $\text{SiO}_2/\text{K}_2\text{O}$  by wt. = 2.04) from  $0^\circ$  to  $175^\circ$  is given by Merrill, 1948. The temperatures at which birefringent phases appeared were used to outline the concentration limits of the isotropic solutions.

# K KALIUM

## CH POTASSIUM PALMITATE $\text{CH}_3(\text{CH}_2)_{14}\text{COOK}$

SOLUBILITY IN AQUEOUS ETHANOL AT 18°  
(Scherings, 1932)

Gms. $\text{C}_2\text{H}_5\text{OH}$ per 100 gms. Solvent	Gms. $\text{CH}_3(\text{CH}_2)_{14}\text{COOK}$ per 100 gms. sat. sol.
49	45.0*
66	19.0
79.5	6.5
96	1.4

\*This result uncertain on account of the colloidal character of the solution.

## POTASSIUM STEARATE $\text{CH}_3(\text{CH}_2)_{16}\text{COOK}$

SOLUBILITY IN AQUEOUS ETHYL ALCOHOL  
(Scherings, 1932)

t°	Gms. $\text{C}_2\text{H}_5\text{OH}$ per 100 gms. Solvent	Gms. $\text{CH}_3(\text{CH}_2)_{16}\text{COOK}$ per 100 gms. sat. sol.
18	49	4.4
18	66	2.6
18	79.5	1.8
18	96	0.62
25	91.53 (d = 0.80935)	0.633*

\*Thomas and Yu, 1923.

## CH POTASSIUM OLEATE $\text{C}_8\text{H}_{17}\text{CH}=\text{CH}(\text{CH}_2)_7\text{COOK}$

100 gms. of aq. 91.53 wt. per cent  $\text{C}_2\text{H}_5\text{OH}$  dissolve 41.1 gms.  $\text{C}_{18}\text{H}_{33}\text{O}_2\text{K}$  at 25° and the saturated solution has  $d = 0.80935$ . (Thomas and Yu, 1923.)

Results are given by McBain and Stewart, 1933, for equilibrium in the System Potassium Oleate + Oleic Acid, determined by observing the temperature of disappearance of the last crystal upon heating, and the first appearance of turbidity upon cooling known mixtures of the two components contained in sealed evacuated tubes. An acid soap of the composition,  $\text{C}_8\text{H}_{17}\text{CH}:\text{CH}(\text{CH}_2)_7\text{COOK} \cdot \text{C}_8\text{H}_{17}\text{CH}:\text{CH}(\text{CH}_2)_7\text{COOH}$  exists below its transition temp. of 47°.

The freezing point depressions of potassium oleate solutions containing excess KOH or iso-octane were measured by Johnston and McBain, 1942 over the range 0 - 0.16 molar.

## POTASSIUM $\alpha$ -NITRILE $\alpha, \alpha$ -DIPHENYL $\alpha'$ -ETHYLSUCCINIC ACID

The solubility at 5° is between 80-100 gms./100 cm<sup>3</sup> H<sub>2</sub>O. (Salmon-Legagneur, 1956.)

POTASSIUM LIGNOCERATE  $C_{23}H_{47}COOH$ 

100 gms. aq. 91.53 wt. per cent ethyl alcohol dissolve 0.153 gm. potassium lignocerate at 25° and the solution has  $d = 0.80935$ . (Thomas and Yu, 1923.)

POTASSIUM Salt of CARYOPHYLLIN  $KC_{30}H_{49}O_4 \cdot 1\frac{1}{2}H_2O$ 

100 gms. Ethyl alcohol dissolve 2.78 gms. of the salt at 20°. (Dodge, 1918)  
 " Methyl alcohol " 40.0 " " " " ( " " )

 OF POTASSIUM HYDROXIDE AT 25°  
 (Basset and Corbet, 1924)

Gms. per 100 gms. sat. sol.			Gms. per 100 gms. sat. sol.		
KCN	KOH*	KCN + KOH	KCN	KOH*	KCN + KOH
41.56	0.11	41.67	34.72	7.39	42.11
41.67	0.69	42.36	33.58	8.96	42.54
38.92	3.3	42.22	26.39	16.29	42.68

\*In terms of KCN. These results show that KOH decreases the solubility of KCN in water. Hence accurate results require that KCN free of KOH must be used for solubility determinations.

THE SYSTEM POTASSIUM CYANIDE - NICKEL CYANIDE - WATER AT 25°  
 (Corbet, 1926)

Note.--In the case of this and the following experiments by Basset and Corbet the authors prepared the KCN from pure double salts in order to obtain it free of KOH. In order to prevent oxidation an atmosphere of coal gas previously passed through solutions of lead acetate and sodium hydroxide was maintained in the bottles. Both the liquid and the solid phases were analyzed.

100.0	0.974

POTASSIUM CHROMOCYANIDE  $K_3Cr(CN)_6$ 100 gms.  $H_2O$  dissolve 32.33 gms.  $K_3Cr(CN)_6$  at 20°.

(Moissan, 1885; Christensen, 1885)

POTASSIUM FERROCYANIDE  $K_4Fe(CN)_6$ 

CN

## SOLUBILITY IN WATER

The various results are in excellent agreement. The results below are those of Harkins and Pearce, 1916; Fabris 1921, 1931, 1932; Vallance 1922, 1927; Regner and Balej, 1957; Bovalin and Fabris, 1933; Tettamanzi, 1933; Ginnings, Herring and Webb, 1933. The very careful determinations by Vallance, 1927 seem to show a break in the solubility and density curves at 18°, but no change in form of the solid phase was evident. dilatometry also showed a transition at 17.7°.

POTASSIUM FERRICYANIDE K<sub>3</sub>Fe(CN)<sub>6</sub>

CN

SOLUBILITY OF POTASSIUM FERRICYANIDE IN WATER  
(Friend and Smirles, 1928)

The solid phase is K<sub>3</sub>Fe(CN)<sub>6</sub> in all cases and there is no indication of a break in the solubility or density curve. The saturated solutions were prepared by continuous agitation for 6 hours and analyzed by a gravimetric determination of the Fe. The results of Regner and Balej, 1957 (\*) are in reasonable agreement. The previous determinations of Wallace, 1855; Schiff, 1860 and Grube, 1916 are slightly lower than the present results.

## SOLUBILITY OF POTASSIUM FERRICYANIDE IN POTASSIUM HYDROXIDE SOLUTIONS AT 25° (Grube, 1914)

One liter sat. sol. in	0.4687	n KOH contains	342.7 gms. $K_3Fe(CN)_6$
" "	0.9628	" "	302.3 " "
" "	1.949	" "	215.1 " "

## THE SYSTEM POTASSIUM FERRICYANIDE - TERTIARY BUTYL ALCOHOL - WATER AT 25° (Ginnings, Herring and Webb, 1933)

The composition of the homogeneous mixture (plait point) of this system was found to be:

4.3 percent  $K_3Fe(CN)_6$  + 38.0 percent ter.  $(CH_3)_3COH$  + 57.7 percent  $H_2O$ .

The original results for the remaining points on the binodal curve are not given but only the values of a series of arbitrary constants calculated from them by means of empirical equations.

## OTHER SOLVENTS

100 gms. methyl alcohol dissolve 0.31 gm. Potassium ferricyanide at the b. pt. (66°). (Henstock, 1934.)

100 cc. anhy. hydrazine dissolve 2 gms.  $K_3Fe(CN)_6$  at room temp.  
(Welsh and Broderson, 1915)

## CN POTASSIUM Calcium FERROCYANIDE $K_2Ca[Fe(CN)_6]$

The effect of added salts on the solubility of  $K_2Ca[Fe(CN)_6]$  in water was studied by Tananaev and Tikhomirova, 1945.

POTASSIUM PLATINUM CYANIDE  $K_2Pt(CN)_4$ SOLUBILITY IN WATER  
(Terrey and Jolly, 1923)

The transition temperatures (tr. pt.) were determined by the dilatometric method.

t°	Gms. $K_2Pt(CN)_4$ per 100 gms. $H_2O$	Solid Phase

## SCN POTASSIUM THIOCYANATE KSCN

### SOLUBILITY OF POTASSIUM THIOCYANATE IN WATER

Up to 25°, Rudorff, 1869, 1872; Foote, 1903; Wassilijew, 1910, Occleshaw, 1931. At the higher temperatures, Kracek, 1936.

The determinations of Kracek were made by observing the temperature of disappearance of the last crystal in mixtures of KSCN + H<sub>2</sub>O contained in sealed tubes. A polymorphic inversion of KSCN occurs at 140.6°, hence the solubility curve has a break at that point.

Chretien and Hoffer, 1935, by means of the crystallization diagram, found metastable crystalline forms of KSCN having 1/2 and 4/5 mol. of H<sub>2</sub>O at temperatures between the eutectic (-33.2°) and + 6.8°.

THE SYSTEM POTASSIUM THIOCYANATE - TERTIARY BUTYL ALCOHOL - WATER AT 25°  
(Ginnings, Herring and Webb, 1933)

The composition of the homogeneous mixture (plait point) of this system was found to be:

37.9 percent KSCN + 19.3 percent ter. (CH<sub>3</sub>)<sub>3</sub>COH + 42.8 percent H<sub>2</sub>O.

The original results for the remaining points on the binodal curve are not given but only the values of a series of arbitrary constants calculated from them by means of empirical equations.

POTASSIUM CARBONATE  $K_2CO_3$ 

CO

## SOLUBILITY OF POTASSIUM CARBONATE IN WATER

(Mulder, 1864; de Copet, 1872; Meyerhoffer, 1905; Kremann and Zitek, 1909; de Waal, 1910; Osaka, 1910-12; Bain, 1927; Hill and Miller, Jr., 1927; Hill, 1930, 1930(a); Lang and Sukava, 1958)

Other determinations not in good agreement with these are given by Engel, 1888; Köhler, 1897; Greenish and Smith, 1901; Rubitzov, 1918; Blasdale, 1923; Iljinski, 1924; Starkowa, 1931; and Appleby and Lefshman, 1932. The results of Takahashi, 1927 are slightly higher.

Determinations of the equilibrium in aqueous solutions of potassium carbonate and bicarbonate in concentrations up to 2.5 gm. mol. per liter, in relation to the partial pressure of  $CO_2$  in the gas phase in contact with the solution, are given by Walker, Bray & Johnston, 1927.

THE SYSTEM POTASSIUM CARBONATE - AMMONIA - WATER  
(Applebey and Leishman, 1932)

Two liquid layers are formed at concentrations of ammonia above 2.5 percent. The concentrations are expressed in gms. per 100 gms. sat. solution.

Experiments indicate that the upper critical solution temperature is probably above 155°. It was also found that the vapor pressure of the two liquid layers in contact with K<sub>2</sub>CO<sub>3</sub>·2H<sub>2</sub>O becomes greater than atmospheric at about 22.5°.

The data of Guyen, Bieler and Orelli, (p. 84) are in disagreement.

SOLUBILITY OF POTASSIUM CARBONATE IN AMMONIA SOLUTIONS  
(Guyer, Bieler, and Orelli, 1940)

The data below were read from curves given by the authors and are in grams of K<sub>2</sub>CO<sub>3</sub> per 100 grams of solvent. These results do not agree with those of Appleby and Leishman, above.

% NH <sub>3</sub> in Solvent	-30°	-10°	0°	19°

40.5	14.3	"			

A study of the liquid phase separations in the system K<sub>2</sub>CO<sub>3</sub> - K laurate - H<sub>2</sub>O at 23° and 36.5° was made by Dervichian, Titchen and van der Berg, 1950.

THE SYSTEM POTASSIUM CARBONATE - POTASSIUM BICARBONATE - WATER  
(Hill, 1930(a); Luzhnaya and Kosyachkova, 1955)

Results for the 42° isotherm for this system are given by Starkowa, 1931, but the author failed to find the double salt  $K_2CO_3 \cdot 2KHCO_3 \cdot 1\frac{1}{2}H_2O$ . The earlier results of Engel, 1888, at 0°, for this system are also probably inaccurate since his value for  $K_2CO_3$  in water varies so greatly from that of all other investigators.

The data at 50° are those of Luzhnaya and Kosyachkova; Hill's results agree.

THE SYSTEM POTASSIUM CARBONATE - POTASSIUM CHLORATE - WATER  
(Iljinsky, 1924)

NOTE.--Saturation was secured by active shaking at constant temperature. The attainment of equilibrium was controlled by successive density determinations and by analyses. In most cases the time required was 3 to 5 hours. For the triple points and those corresponding to double salts, several days were required. The solid phases were identified by analysis.

## THE SYSTEM $K_2CO_3 - KNO_3 - H_2O$

100 gms.  $H_2O$  dissolve 10.76 gms.  $K_2CO_3$  + 2.66 gms.  $KNO_3$  at  $10^\circ$  when both salts are present in excess.  
(Kremann and Zitek, 1909)

Data for aqueous solutions of  $K_2CO_3 + KNO_3 + Na_2CO_3 + NaNO_3$ , simultaneously saturated with two or more of the salts at  $10^\circ$  and at  $25^\circ$ , are also given by Kremann and Zitek (1909).

## THE SYSTEM POTASSIUM CARBONATE - LITHIUM CARBONATE - WATER AT $25^\circ$ (Urazov and Lifatova, 1944)

The data are also given in mole % and moles per 100 gms. of  $H_2O$ .

## THE SYSTEM POTASSIUM CARBONATE - SODIUM CARBONATE - WATER

The system has been studied in considerable detail. Earlier workers (Kreman and Zitek, 1909; Osaka, 1910-11; Iljinsky, 1924; Bain, 1927) report the formation of a hydrated double carbonate of potassium and sodium. The later very careful determinations of Hill and Miller, Jr., 1927, show that at no temperature between 20° and 50° is a hydrated double carbonate formed, but that the material which exists in contact with the saturated solutions is a hydrated solid solution, the composition of which can vary over a considerable range. Due to the slowness with which equilibrium

# K KALIUM

is reached, in all cases in which solid solution is formed, the authors found it necessary to prepare the mixtures in a special manner which would reduce the length of time required for attainment of the internal equilibrium of the solid solution or anhydrous double compound. The saturated solutions were analyzed by evaporation to dryness and estimation of the  $H_2O$  by loss in weight. The total carbonates were determined by titration and from this result and the known weight of the mixed carbonates the percentage of each was calculated. The results are re-recorded in percentage of  $H_2O$  and  $Na_2CO_3$ . In the following table the  $K_2CO_3$  values have been obtained by subtracting the sum of  $H_2O + Na_2SO_4$  from 100. Results for the quintuple points are also given.

The data at  $-6^\circ$  and  $+10^\circ$  are from Iljinsky, 1924; those at  $40^\circ$  are from Bain, 1927. Bain determined combined potassium and sodium by weighing as chlorides. The potassium was determined as perchlorate. CO The existence of  $Na_2CO_3 \cdot 3H_2O$  was demonstrated and its transition point to  $Na_2CO_3 \cdot H_2O$  found to be  $39.8^\circ$ .

Above  $100^\circ$ , the data of Ervin, Giorgi and McCarthy, 1944 and Ravich, Itkina and Kokhova, 1954 are in excellent agreement. The earlier work of Makarov and Shulgina, which seemed to indicate the disappearance of the anhydrous double salt with increasing temperature, is incorrect. R. I. and K. found both  $Na_2CO_3 \cdot H_2O$  and  $Na_2CO_3$  stable at  $100^\circ$ .

## DIAGRAM OF RECIPROCAL SYSTEM

Data for equilibrium in the system,  $K_2CO_3 + 2NaHCO_3 \rightleftharpoons 2KHCO_3 + Na_2CO_3$  in water at 25°, are given by Hill and Smith, 1929.

The authors first give the previously determined data for the four 3 component systems;  $K_2CO_3 + Na_2CO_3 + H_2O$ ,  $K_2CO_3 + KHCO_3 + H_2O$ ,  $KHCO_3 + NaHCO_3 + H_2O$  and  $Na_2CO_3 + NaHCO_3 + H_2O$ , calculated to gram mols. per 1000 gm. mols.  $H_2O$ . They then report their results for saturated solutions each composed of water and three of the above four compounds and in contact with two or three of the several solid phases which exist at 25°. The results show the location of 14 curves representing the solubility equilibrium existing with two solid phases, and of seven isothermal invariant points at which the solution is in equilibrium with 3 solid phases. A new tetragene salt was found, having the formula  $K_2CO_3 \cdot NaHCO_3 \cdot 2H_2O$  and not occurring in any of the 3 component systems.

In a later paper Hill, 1930 gives results for double salt formation among the carbonates and bicarbonates of potassium and sodium at 25° and at 35°. The partial isotherms show that the double salt  $K_2CO_3 \cdot 2KHCO_3 \cdot 1\frac{1}{2}H_2O$  and the tetragene salt  $K_2CO_3 \cdot NaHCO_3 \cdot 2H_2O$  both exist at these two temperatures.

Data for the aqueous system  $KCl + NaCl + Na_2SO_4 + K_2SO_4 + Na_2CO_3 + K_2CO_3$  at 20°, 35°, 50°, 75°, 100° are given by Teeple, 1929.

Data for equilibrium in the system composed of  $K_2CO_3 + PbCrO_4 \rightleftharpoons K_2CrO_4 + PbCO_3 (+ H_2O)$  at 25° are given by Goldblum and Stoffella, 1910.

Data for the reciprocal salt pair  $K_2CO_3 + BaSO_4 \rightleftharpoons K_2SO_4 + BaCO_3$  at 25°, 80° and 100° are given by Meyerhoffer (1905). An aqueous solution, simultaneously saturated with  $K_2CO_3 \cdot 2H_2O$ ,  $K_2SO_4$  and  $BaCO_3$ , contains 53.1 gms.  $K_2CO_3 + 0.023$  gm.  $K_2SO_4$  at 25°.

## THE SYSTEM POTASSIUM CARBONATE - METHYL ALCOHOL - WATER AT 23°-26° (Frankforter and Frary, 1913)

The authors give the data for the binodal curve and the quadruple points, but tie lines, other than for the quadruple points, were not determined.

\*Tie line which shows the composition of each of two liquid layers in contact with each other. The one being the upper, rich in isopropyl alcohol and the other, the lower, rich in K<sub>2</sub>CO<sub>3</sub>.

PP is the plait point which shows the composition at that point on the binodal curve where the two layers merge into a homogeneous liquid.

THE SYSTEM POTASSIUM CARBONATE - TERTIARY BUTYL  
ALCOHOL - WATER AT 30°  
(Ginnings and Robbins, 1930)

The points on the binodal curve were determined by observing the appearance or disappearance of clouding in a mixture of weighed amounts of salt and one of the liquids, upon addition of a weighed amount of the other. The conjugated points were found by preparing mixtures which yielded two liquid layers and analyzing each for salt content. The plait point, P.P., was found by plotting. The following results are those given in the authors' table under the column heading K<sub>2</sub>SO<sub>4</sub> which was evidently intended for K<sub>2</sub>CO<sub>3</sub>.

## K KALIUM

THE SYSTEM POTASSIUM CARBONATE - TERTIARY BUTYL  
ALCOHOL - WATER AT 30°--Cont.

				Conjugation Point Data	
Gms. per 100 gms. $K_2CO_3 + (CH_3)_3COH + H_2O$		Gms. per 100 gms. $K_2CO_3 + (CH_3)_3COH + H_2O$		Wt. percent $(CH_3)_3COH$ in butanol rich phase	Wt. percent $K_2CO_3$ in salt rich phase
$K_2CO_3$	$(CH_3)_3COH$	$K_2CO_3$	$(CH_3)_3COH$		
0.7	57.8	9.8	9.1	69	34.2
1.8	39.3	11.4	7.5	62	24.4
3.1	26.9	13.3	5.9	53	14.8
4.8	18.9	15.4	4.5	27	3.2 P.P.*
5.1	17.7	17.0	3.5		
CO 5.8	16.1	26.7	0.9		
7.2	12.8	34.2	0.4		

\*In a later paper by Ginnings, Herring and Webb, 1933, the values given for the plait point, P.P., are respectively, 2.3 percent  $K_2CO_3$  and 36.3 percent  $(CH_3)_3COH$  instead of 3.2 and 27 as shown above.

THE SYSTEM POTASSIUM CARBONATE - ALLYL ALCOHOL - WATER AT 20°  
(Frankforter and Temple, 1915)

Gms. per 100 Gms. Solvent (Alcohol + Water)			Gms. per 100 Gms. Solvent (Alcohol + Water)		
$K_2CO_3$	Alcohol	Water	$K_2CO_3$	Alcohol	Water
47.746	2.103	97.897	8.239	30.677	69.323
33.200	5.267	94.733	5.521	39.337	60.663
23.486	9.309	90.691	2.020	54.487	45.513
16.354	15.037	84.963	1.015	62.610	37.390
11.331	22.454	77.546	0.0853	81.228	18.772

The binodal curve for this system at 25° has also been determined by Ginnings and Dees, 1935, but the authors do not give their experimental results but only a series of arbitrary constants calculated from them by means of an empirical equation. From these the conclusion is drawn that allyl alcohol seems to be more difficult to salt out than either iso propyl or normal propyl alcohol.

THE SYSTEM POTASSIUM CARBONATE - ACETONE - WATER AT 20°  
(Frankforter and Cohen, 1914)

The binodal curve was very carefully determined and, in addition, data for the quadruple points (solid  $K_2CO_3$ ) and give tie lines were located. These data were plotted and the following interpolated values for the conjugated liquids read from the curve.

Gms. per 100 Gms. Upper Layer			Gms. per 100 Gms. Lower Layer		
$K_2CO_3$	$(CH_3)_2CO$	$H_2O$	$K_2CO_3$	$(CH_3)_2CO$	$H_2O$

\*Diagram for the K<sub>2</sub>CO<sub>3</sub> - pyridine - water system. See page 101.

Diagram for the  $K_2CO_3$  - pyridine - water system.

Cl

100 cc. anhydrous hydrazine dissolve 1 gm.  $K_2CO_3$  at room temperature.  
(Welsh and Broderson, 1915)

100 gms. aqueous solution simultaneously sat. with  $K_2CO_3$  and cane sugar at  $31.25^\circ$  contain 22.24 gms.  $K_2CO_3$  and 56 gms. sugar. (Kohler, 1897)

Melting point data are given for:

$K_2CO_3 + KCl$  (Sackur, 1911-12)  
 " +  $2NaCl \rightleftharpoons 2KCl + Na_2CO_3$  (Sackur, 1911-12; Volkov and Bergman, 1942; Nyankovskaya, 1952)  
 " +  $K_2SO_4$  (LeChatelier, 1894; Amadori, 1912)  
 " +  $Na_2CO_3$  (LeChatelier, 1894; Makarov and Shulgina, 1940a)  
 " +  $Nb_2O_5$  (Reisman and Holtzberg, 1955)  
 " +  $V_2O_5$  (Holtzberg, Reisman, Berry and Berkenblit, 1956)  
 " +  $2NaOH \rightleftharpoons 2KOH + Na_2CO_3$  (Khitrov, 1954)  
 " +  $K_2CrO_4$  (Gromakov, 1951)  
 " +  $KI$  (Nyankovskaya, 1952, 1953)  
 " +  $2NaI \rightleftharpoons 2KI + Na_2CO_3$  (Nyankovskaya, 1952, 1953)  
 " +  $KF + K_2SO_4$  (Bergman and Rubleva, 1957)  
 " +  $2LiF \rightleftharpoons 2KF + Li_2CO_3$  (Volkov and Shvab, 1953)  
 " +  $NaF + Na_2SO_4$  (Bergman and Rubleva, 1957a)  
 " +  $NaF + K_2SO_4$  (Bergman and Rubleva, 1957a)  
 $K^+, Na^+ \parallel F^-, SO_4^{2-}, CO_3^{2-}$  (Bergman and Rubleva, 1957a)  
 $K_2CO_3 + 2NaF \rightleftharpoons 2KF + Na_2CO_3$  (Volkov and Bergman, 1942)  
 $K_2CO_3 + K_2SO_4 + NaCl$  (Bergman and Sementsova, 1958)

# K KALIUM

## CO POTASSIUM MAGNESIUM CARBONATE $K_2Mg(CO_3)_2 \cdot 4H_2O$

SOLUBILITY IN AQUEOUS KCl SOLUTIONS AT 17°  
(Halla, 1936)

Gm. Mols. per 1000 gms. H <sub>2</sub> O		Solid Phase
KCl	$K_2Mg(CO_3)_2$	
0.274	0.0381	$K_2Mg(CO_3)_2 \cdot 4H_2O$
0.790	0.0352	"
1.490	0.0268	"
2.365	0.0191	"
3.38	0.0139	"

## POTASSIUM URANYL CARBONATE $2K_2CO_3 \cdot (UO_2)CO_3$

100 gms. H<sub>2</sub>O dissolve 7.4 gms. salt at 15°. (Ebelmen, 1852)

This salt is only about 1/50 as soluble as the La and Ce uranyl carbonates.  
(Yakolov and Gorbenko-Germanov, 1956)

## HCO POTASSIUM BICARBONATE $KHCO_3$

SOLUBILITY OF POTASSIUM BICARBONATE IN WATER

(Diblets, 1874; Engel, 1888; Greenish and Smith, 1901; de Forcrand, 1909; Foerster, Brosche and Norberg-Schulz, 1924; Hill and Hill, 1927; Oglesby, 1929; Hill, 1930(a); Starkowa, 1931 and Paris and Mondain-Monval, 1938; Luzbnaya and Kosyachkova, 1955)

The results of the above named investigators varied very slightly from the smoothed curve from which the following values were read.

t°	d. of sat. sol.	Gms. $KHCO_3$ per 100 gms. sat. sol.	Solid Phase
- 0.70	--	2.17	Ice
- 2.16	--	5.77	"
- 3.21	--	9.98	"
- 3.90	--	12.60	"
- 5.43 Eutec.	--	16.95	" + $KHCO_3$
0	1.130	18.6	$KHCO_3$
+10	1.154	21.8	"
20	1.178	25.0	"
25	1.188	26.6	"
30	1.199	28.1	"
40	1.217	31.3	"
50	--	34.2	"
60	--	37.5	"
70	--	40.6	"

The following results of Takahashi, 1927 were obtained under 1 atm. pressure of CO<sub>2</sub> and differ only slightly from the averages above.

t°	d. of sat. sol.	Gms. $KHCO_3$ per 100 gms. sat. sol.	t°	d. of sat. sol.	Gms. $KHCO_3$ per 100 gms. sat. sol.
0	1.1329	18.41	40	1.2196	32.24
10	1.1544	21.53	50	1.2439	36.04

30	1.2004	28.52	70	1.3005	43.37

THE SYSTEM POTASSIUM BICARBONATE - POTASSIUM CHLORIDE - WATER  
(Paris and Mondain-Monval, 1938)

In order to have an excess of  $\text{CO}_2$  present, the authors used, for preparing the saturated solutions, water previously saturated at about  $2^\circ$  with  $\text{CO}_2$ , instead of pure water. Saturation was thus affected under 1 to 2 atmospheres pressure of  $\text{CO}_2$ .

THE SYSTEM POTASSIUM BICARBONATE - SODIUM BICARBONATE - WATER  
(Oglesby, 1929; Luzhnaya and Kosyachkova, 1956 ( $50^\circ$ ))

Carbon dioxide was bubbled through the solutions prior to the period of saturation and afterwards an atmosphere of  $\text{CO}_2$  was maintained above the surface of the solutions. The analyses were made by titrating the total alkali with HCl and determining the K by the perchloric acid method. Results at  $0^\circ$  are given by Kratom, 1935. Results at  $35^\circ$  which do not agree well with the others are listed by Teeple, 1929.

## K KALIUM

COO POTASSIUM OXALATE  $K_2C_2O_4$ 

## SOLUBILITY IN WATER

The data of Woskressenskaya, 1926 and of Koppel and Cahn, 1908 agree at about 25°. Below 25° Koppel and Cahn are consistently higher, and above 25° lower, than Woskressenskaya. Several other determinations also agree at 25°. The 50° value of Rivett and O'Connor, 1919 agrees with Woskressenskaya. The data above the boiling point are from Benrath, 1942. The solid phase is  $K_2C_2O_4 \cdot H_2O$  above the eutectic.

## THE SYSTEM POTASSIUM OXALATE - OXALIC ACID - WATER

Data at 0°, 30°, and 60° are by Koppel and Cahn, 1908. At 25° the data of Hartley, Drugman, Vlieland and Bourdillon, 1913, were used at lower concentrations (up to 6%  $K_2O$ ) and those of Foote and Andrew, 1905, for the higher concentrations. The two sets of data are in good agreement on the invariant points.

THE SYSTEM POTASSIUM OXALATE, NICKEL OXALATE AND WATER AT 30°  
(Vosburg, Israel and Birch, 1936)

The period of rotation was a week or more and special precautions were necessary to insure that the right solid phase was present. The oxalate content of the samples was determined by permanganate titration and the nickel content either by dimethyl glyoxime or cyanide titration.

SS = Solid solutions of potassium and nickel oxalates. Analyses showed that water of crystallization in the double compound was most probably 4H<sub>2</sub>O.

Evidence was also obtained for the metastable existence of the compound K<sub>2</sub>Zn<sub>2</sub>(C<sub>2</sub>O<sub>4</sub>)<sub>3</sub>·12H<sub>2</sub>O and the composition of several metastable solutions in contact with this compound are given.

THE SYSTEM POTASSIUM OXALATE - ZIRCONYL OXALATE - WATER AT 35°  
(Boulanger, 1936)

Tabular results are given for the temperatures 19°, 35° and 52°. Those at 19° yield a very irregular curve. Those at 35° and 52° although giving somewhat better curves probably do not represent equilibrium conditions. The following values taken from the 35° curve indicate roughly the general nature of the system.

	Gms. per 100 gms. sat. sol.		Solid Phase	Gms. per 100 gms. Sat. sol.		Solid Phase

## POTASSIUM COLUMBATES

Cbo

SOLUBILITY IN WATER AT 25°  
(Windmaisser, 1942)

Salt	Gms. Anhydrous Salt per 100 gms. Sat. Sol.
$4K_2O \cdot 3Cb_2O_5 \cdot 16H_2O$	56
$*7K_2O \cdot 6Cb_2O_5 \cdot (H_2O)$	55.08
$KCbO_2 \cdot 2H_2O$	59.53

\*The equilibrium diagram of the system  $4K_2O \cdot 3Cb_2O_5 \cdot 16H_2O + K_2CO_3 + H_2O$  at 25° is also given. The 4:3 salt is converted to the 7:6 in solutions containing over 1%  $K_2CO_3$ . The previous 8:7 salt was shown actually to be 7:6.

## POTASSIUM CHLORIDE KCl

Cl

## THE SYSTEM POTASSIUM CHLORIDE - WATER

A very large number of determinations have been made, with generally good agreement between older and recent values. The data below were read from average curves drawn through the various results. The freezing points are by Klein and Svanberg (1920), Rodebush (1918), Barnes and Maass (1930), and Shulgina, Karchuk, and Yanat'eva (1955). Above 100° the average of determinations by Keevil (1942), Cornec and Krombach (1932), Achumow and Wassilijew (1932), and Benrath, Gjedebø, Schiffrers and Wunderlich (1937) is given. Further high temperature results are given by Ravich and Borovaya, 1950. The other data are from Meusser (1905), Kohler (1897), Andrae (1884), Gerardin (1865), de Coppet (1883), Etard (1894), Mulder (1864), Anosov and Byzova (1947), Foote (1927), Wright (1927), Scott and Frazier (1927), Malquori, (1927, 1928a), Flottmann (1928), Cornec and Krombach (1923), Lannung (1934), Hering (1936), and Nallet, 1955. A monohydrate was first reported by Fialkov and Chernogorenko, 1955, and Chernogorenko, 1958. Later very careful determinations by Shul'gina, Kharchuk, and Yanat'eva, 1955 confirmed its presence, but these authors were uncertain of its composition. It may contain 1 - 1½ moles of water. The data from the eutectic to 0° are those of S.K. and Y.

## THE SOLUBILITY OF POTASSIUM CHLORIDE IN DEUTERIUM OXIDE AND IN ORDINARY WATER (Shearman and Menzies, 1937)

The deuterium water had a content of 98.2% D<sub>2</sub>O and a density relative to that of ordinary water, of 1.1059. The results are reported in moles of KCl per 1000 gms. of water (= 55.51 moles H<sub>2</sub>O) and in 1111.7 gms. of deuterium water (= 55.51 moles D<sub>2</sub>O). The same 0.4086 gm. of KCl was employed in both solvents and the amount of deuterium water was 1.39 gm. The actual measurements were graphed and the following values for round temperatures obtained.

t°	Moles KCl per 55.51 moles:		t°	Moles KCl per 55.51 moles:	
	H <sub>2</sub> O	D <sub>2</sub> O		H <sub>2</sub> O	D <sub>2</sub> O

THE SYSTEM  $\text{KCl} + \text{NaClO}_3 \rightleftharpoons \text{KClO}_3 + \text{NaCl} (+ \text{H}_2\text{O})$   
(Nallet, 1955; Nallet and Paris, 1956)

Other data for the invariants ( $0^\circ$ ,  $40^\circ$ ) are given by Munter and Brown, 1943. The results of DiCapua and Scaletti, 1927 are in error. Densities were also determined. The figures in parenthesis are grams of  $\text{H}_2\text{O}$  per mole of dissolved salts.

THE SYSTEM POTASSIUM CHLORIDE - POTASSIUM IODIDE - WATER  
 (Zhdanov and Kovolenko, 1948; Amadori and Pampanini, 1911;  
 Harris and Christiansen, 1934; Etard, 1894)

The data are in good agreement: Amadori and Pampanini's results at 25° are similar to those of Zhdanov and Kovolenko, given in the table. Note the different units (g/100 cc) of Harris and Christiansen's data (20, 30, 40°). Empirical equations for the solubility of potassium chloride as a function of the concentration of potassium iodide in solution at 0°, 25°, 50°, and 75° are given by Zhdanov, 1948.

## THE SYSTEM POTASSIUM CHLORIDE - POTASSIUM NITRATE - WATER

The various data have been recalculated to a weight percent basis. Additional results for this system at 0°, 20°, 40°, 60°, 80°, 100° and 320° in terms of the number of gm. mols. H<sub>2</sub>O required to dissolve 100 gm. mols. of the two salts of determined molecular ratio, are given by Janecke, 1928. Results at 14.5° and 25.2° in gm. per liter of saturated solution are given by Touren, 1900. Additional data at 20° are given by Leather and Mukerji, 1913 and Soch, 1898, and at 25° by Armstrong and Eyre, 1910-11. Additional data at 80, 100 and 125° are given by Uspenskaya and Bergman, 1955. Early work by Etard, 1894, Rudorff, 1873, Nichol, 1891.

Cl

Nikolaeff and Kogan, 1938 determined the solubilities of  $\text{KNO}_3$ ,  $\text{KCl}$ , and  $\text{HNO}_3$  in solutions containing 5%, 7%, 10%, and 15%  $\text{HCl}$  in water from  $-50^\circ$  to  $+60^\circ$ . The results are expressed in %  $\text{N}_2\text{O}_5$ , %  $\text{K}_2\text{O}$ , and %  $\text{HCl}$  in the saturated solutions.

Data for the system  $\text{KCl} + \text{KNO}_3 + \text{H}_2\text{O}$  with added  $\text{HCl}$  and  $\text{KOH}$  are given by Nikalajew, 1929.

THE SYSTEM  $\text{KCl} + \text{KNO}_3 + \text{NH}_3 + \text{H}_2\text{O}$   
(Alexandrov, 1946)

## THE SYSTEM $\text{KCl} + \text{NH}_4\text{NO}_3 \rightleftharpoons \text{KNO}_3 + \text{NH}_4\text{Cl} (+\text{H}_2\text{O})$

Data for this system are given by Janecke, 1928 from  $0^\circ$ – $80^\circ$ , Aronawa and Lunskaia, 1933 at  $100^\circ$ , Kritschewsky and Goldmann, 1934 at  $-10^\circ$  and  $-15^\circ$ . Bergman, 1938 gives data from  $-15^\circ$  to  $+30^\circ$  for the sections  $\text{KCl} + \text{NH}_4\text{NO}_3 + \text{H}_2\text{O}$  and  $\text{KNO}_3 + \text{NH}_4\text{Cl} + \text{H}_2\text{O}$ . The eutectic is at  $-16.4^\circ$ , with  $\text{KNO}_3 + \text{NH}_4\text{Cl} + \text{ICE}$  as saturating phases. Below  $24.4^\circ$  the stable salt pair is  $\text{KNO}_3 + \text{NH}_4\text{Cl}$ .

## THE SYSTEM $\text{KCl} + \text{NaNO}_3 \rightleftharpoons \text{KNO}_3 + \text{NaCl} (+\text{H}_2\text{O})$ (Reinders, 1914, 1915; see also Uyeda, 1909–10)

Additional data at  $80^\circ$ ,  $100^\circ$  and  $125^\circ$  are given by Uspenskaya and Bergman, 1955. For data below  $25^\circ$ , see Khitrova, 1956.

THE SYSTEM  $K^+$ ,  $Na^+||Cl^-$ ,  $NO_3^-$ ,  $SO_4^{=}$ , +  $H_2O$ 

Complete experimental data, including densities, in the form of tabular results and diagrams for this complex system at temperatures between 0° and 90° are given by Cornec and Krombach, 1929, and Cornec, Krombach and Spack, 1930. These authors have made use, when necessary, of the results for the ternary and quaternary systems previously reported from their own laboratory and by other workers, including, Chretien, 1929, Cornec and Hering, 1925-7, Cornec and Krombach, 1929, Meyerhoffer and Saunders, 1899, d'Ans, 1915 and Blasdale, 1918.

# K KALIUM

## THE SYSTEM $K^+, NH_4^+, Na^+ || Cl^-, NO_3^- + H_2O$ AT $20^\circ$ (Schutse, Piechowicz, and Wahl, 1943)

Moles per 1000 moles of Water					Solid Phases
$K^+$	$NH_4^+$	$Na^+$	$Cl^-$	$NO_3^-$	
26.1	66.9	73.1	166.1	--	$KCl + NH_4Cl + NaCl$

65.6	99.7	104.6	158.7	112.2	$KCl + NH_4Cl + NaCl + KNO_3$
80	202	181	114	349	$NH_4Cl + NaCl + NaNO_3 + KNO_3$
95	415	172	100	582	$NH_4Cl + KNO_3 + NH_4NO_3 + NaNO_3$

Results for the system  $KCl + KNO_3 + NH_4H_2PO_4 + H_2O$  from  $-11.7^\circ$  to  $+35^\circ$  are given by Bergman and Shakhparonov, 1952.

Cryoacopic, transport and pH data for the system  $KCl - HgCl_2 - H_2O$  showing 2 complexes (2:1, 1:1) are given by Aggarwal, 1957.

## THE SYSTEM POTASSIUM CHLORIDE - POTASSIUM DIHYDROGEN PHOSPHATE - WATER

The system  $KCl - KH_2PO_4 - H_2O$  was studied by Polosin and Shakhparonov, 1939 from the eutectic to  $+35^\circ$ . No compounds were formed. The eutectic temperature is  $-10.8^\circ$  and the saturated solution contains 18.84%  $KCl$  and 2.31%  $KH_2PO_4$ .

The data below are those of Askenasy and Nessler, 1930 at  $0^\circ$ . They are expressed in the Janecke method which is in terms of the number of gm. mols. of  $H_2O$  required to dissolve 100 gm. mols. of salt or salt mixture of determined molecular composition.

d. of sat. sol.	Composition of Dissolved Salts in Gm. Mols.		Gm. Mols. $H_2O$ to dissolve 100 gm. mols. salt mixture	Solid Phase
	$KCl$	$KH_2PO_4$

1.1151	0.0	100.0	4125	"

## THE SYSTEM $KCl + NH_4H_2PO_4 \rightleftharpoons KH_2PO_4 + NH_4Cl (+H_2O)$

Data for the composition of saturated solutions containing  $KCl$  and  $NH_4H_2PO_4$ , with solid solutions  $(K, NH_4)Cl$  and  $(K, NH_4)H_2PO_4$  as saturating phases are given by Polosin and Shakhparonov, 1947 from  $-11.2$  to  $35^\circ$ . Askenasy and Nessler, 1930 give data for the system at  $0^\circ$ . Kurnakov, Zvorykin and Ketkovich, 1948 give data for the system at  $25^\circ$ , alone and with various amounts of added  $NH_3$ .

<sup>1</sup>Campbell, Downs, and Samis, 1934.<sup>2</sup>Hering, 1926.<sup>3</sup>Precht and Wittgen.THE SYSTEM  $2KCl + (NH_4)_2SO_4 \rightleftharpoons K_2SO_4 + 2NH_4Cl (+H_2O)$  AT 25°  
(Hill and Loucks, 1937)

The authors also give results for the 4 component systems saturated with solid phases composed of mixtures of the three solid solutions of the salts. They also investigated, for the purpose of industrial preparation of  $K_2SO_4$ , the field in which this salt separates in order to learn what percentage of  $(NH_4)_2SO_4$  accompanies it as a contamination.

The results in parentheses show the composition of the solid solutions present as solid phases.

Results for the 3 component Systems in water at 25°:

Cl

Results for the system  $2\text{KCl} + \text{Na}_2\text{SO}_4 \rightleftharpoons \text{K}_2\text{SO}_4 + 2\text{NaCl}$  in solutions containing up to 35% NH<sub>3</sub> at 20°, 0° and -15° are given by Chevetin and Gilliot, 1950 and Gilliot, 1951.

THE SYSTEM K<sup>+</sup>, Na<sup>+</sup> || Cl<sup>-</sup>, SO<sub>4</sub><sup>=</sup>, NO<sub>3</sub><sup>-</sup> (+H<sub>2</sub>O)

Complete experimental data, including densities, in the form of tabular results and diagrams for these complex systems at temperatures between 0° and 90° are given by Cornec and Krombach, 1929 and Cornec, Krombach and Spack, 1930. These authors made use, wherever necessary of the results for the ternary systems previously reported from their own laboratory or by others including Chretien, 1929; Cornec and Hering, 1925-7, Cornec and Krombach, 1929; Meyerhoffer and Saunders, 1899; d'Ans, 1915 and Blasdale, 1918.

THE SYSTEM K<sup>+</sup>, Na<sup>+</sup>, Mg<sup>++</sup> || Cl<sup>-</sup>, SO<sub>4</sub><sup>=</sup> (+H<sub>2</sub>O)

Data for this system are given by Froehlich, 1929 (20°-200°); Campbell, Downs, and Samis, 1934 (100°); Karsten, 1950, who refers to Yanat'eva work (1949a); Feakes, 1952 (90°). A study of the metastable equilibria in the system is reported by Valyashko and Solov'eva, 1949.

Data for the system  $2\text{KCl} + \text{MgBr}_2 \rightleftharpoons 2\text{KBr} + \text{MgCl}_2$  (+H<sub>2</sub>O) at 20°, re-calculated from the results of Boeke, 1908, are given by Janেকে, 1938.

THE SYSTEM 2KCl + MgSO<sub>4</sub> = K<sub>2</sub>SO<sub>4</sub> + MgCl<sub>2</sub> (+H<sub>2</sub>O)

The system has been studied by Kurnakov and Shoikhet, 1938 (25°); Kurnakov and Loukianova, 1938 (25°); Lepeahkov and Bodaleva, 1949 (25°); Autenrieth, 1954 (15, 25, 35, 55°); Zorkin and Petukhova, 1940 (35, 50°); Solov'eva, 1949 (24°); Solov'eva, 1953 (15°); Luk'yanova, Sokol and Sololova, 1956 (75°). Autenrieth, 1954 also gives data in solutions simultaneously saturated with NaCl at 25°, 35° and in solutions saturated with KCl at 15, 25, 35, 55°.

Data for the System KCl + RbCl + MgCl<sub>2</sub> + H<sub>2</sub>O at 25°, recalculated from the results of D'ans and Bush, 1937, are given by Janecke, 1937, 1938. The 100° isotherm of this system is reported by Makarov, Perelman and Logkova, 1941.

The distribution of bromide ions between solid phases and liquid phases in systems containing K<sup>+</sup>, Mg<sup>++</sup>, Na<sup>+</sup>, Cl<sup>-</sup> and H<sub>2</sub>O was studied by Cirkov and Schnee, 1939. The effect of the rate of crystallization on the distribution was also determined.

The distribution of micro amounts of Br<sup>-</sup> between the solution and solid phases during isothermal evaporation was studied by Cirkov, 1944, in the following systems: KCl + H<sub>2</sub>O at 25°, 107°; KCl + NaCl + H<sub>2</sub>O at 25°; KCl + I<sup>-</sup> + H<sub>2</sub>O at 25°; KCl + NaCl + I<sup>-</sup> + H<sub>2</sub>O at 25°; KCl + MgCl<sub>2</sub> + H<sub>2</sub>O at 35°.

The system K<sup>+</sup>, Mg<sup>++</sup>, Na<sup>+</sup> || Cl<sup>-</sup>, SO<sub>4</sub><sup>=</sup> + H<sub>2</sub>O is reported by Yanat'eva, 1949a. Various graphical representations of the system are given by Pel'sh, 1953. For data above 100° see Achoumow and Wassilijew, 1932.

The system KCl - MnCl<sub>2</sub> - H<sub>2</sub>O was studied from the eutectic to + 20° by polythermal analysis by Ozerov, 1953.

## THE SYSTEM POTASSIUM CHLORIDE - AMMONIUM CHLORIDE - WATER

The salts from 2 series of limited solid solutions. Most of the data are in good agreement. Additional results are given by Uyeda, 1912.

Results expressed on a weight basis. (See also below)

Results are given for the following systems:

#### THE SYSTEM POTASSIUM CHLORIDE - SODIUM CHLORIDE - WATER

(Cornec and Krombach, 1932; Blasdale, 1918; Ackoumov and Wassilijew, 1932; Bergman and Vlassov, 1949; See also DiCapua and Scalletti, 1927 at 20°, Holluta and Moutner, 1927 at 18.5°)

The earlier data of Precht and Wittgen, 1881; Etard, 1897; Leather and Mukerji, 1913; Nichol, 1891; Reinders, 1915; and D'Ans, 1915 are not in very good agreement with those given below. From the eutectic to 190°, the data are those of Cornec and Krombach, 1932; from 100 to 300°, Ackoumov and Wassilijew. Results from 300 to 600°, up to 350 atm. pressure are given by Ravich and Borovaya, 1949, 1950.

## THE SOLUBILITY OF POTASSIUM CHLORIDE IN AQUEOUS SOLUTIONS OF MIXTURES OF OTHER SALTS

The polytherms of the four salt points of the potassium chloride field in quinary systems of oceanic salt deposits have been redetermined with great care by Soroway, 1923. This is a repetition and extension of the fundamental work of Van't Hoff, D'Ans and others. Results at temperatures between 0° and 120° are given for the equilibrium solution Q (Van't Hoff) in contact with KCl + NaCl + carnallite + kainite or kieserite; at temperatures between 60.5° and 120° for the equilibrium solution P in contact with KCl + NaCl + glaserite + langbeinite; between 0° and 120° for the equilibrium solution F in contact with KCl + NaCl + glaserite; between 0° and 120° for the equilibrium solution E in contact with KCl + NaCl + carnallite and between 23° and 120° for the equilibrium solution R in contact with NaCl + kainite + kieserite + carnallite and with KCl + NaCl + kieserite + langbeinite.

SOLUBILITY OF MIXTURES OF POTASSIUM CHLORIDE AND OF SODIUM CHLORIDE IN AQUEOUS HYDROCHLORIC ACID SOLUTIONS AT 25°  
(Hicks, 1915)

Gms. per 100 gms. sat. solutions		
HCl	NaCl	KCl
0	19.95	10.90
8.61	10.65	7.58
17.16	3.56	3.80
20.65	2.03	2.86
32.78	0.18	1.27

POTASSIUM Palladium CHLORIDE  $K_2PdCl_6$ 

From measurements of the solubility of Potassium Chloro-palladate ( $K_2PdCl_6$ ) at  $25^\circ$  in normal aqueous Hydrochloric Acid containing KCl and saturated with Chlorine at atmospheric pressure, the Solubility Product  $-K^+)^2(PdCl_6^{--})$  was found to be  $5.97 \times 10^{-6}$ . (Wellman, 1930)

## POTASSIUM Platinum CHLORIDE (See PLATINUM CHLORIDES)

THE SYSTEM POTASSIUM CHLORIDE - RUBIDIUM CHLORIDE - WATER AT  $25^\circ$   
(D'Ans and Bush, 1937)

THE SYSTEM KCl + RbCl IN AQ. ETHANOL SATURATED WITH HCl AT  $20^\circ$   
(Meier and Treadwell, 1951, 1951a)

100 mg. of the chlorides were dissolved in 5 ml. of hot conc. HCl ( $d = 1.19$ ) under reflux and then cooled. 25 ml. of alcohol ( $d = .795$ ) were then added dropwise to the clear solutions, with stirring, over a 30 minute period. The mixture was saturated with HCl gas. The crystals and liquid phase had the following composition:

Mole % KCl in:

Liquid phase	0.12	1.44	5.68	6.85	21.32
Solid phase	26.6	41.6	53.2	74.9	92.0

## K KALIUM

THE SYSTEM POTASSIUM CHLORIDE - TERTIARY BUTYL  
ALCOHOL - WATER AT 30°  
(Ginning and Robbins, 1930)

The results which were determined by the synthetic method locate the binodal curve of the system and include tie lines\* which show the composition of layers in contact with each other and the plait point, PP, at which the two liquid layers become homogeneous.

	Gms. per 100 gms. sat. sol.		Gms. per 100 gms. sat. sol.		Gms. per 100 gms. sat. sol.	
	(CH <sub>3</sub> ) <sub>3</sub> COH	KCl	(CH <sub>3</sub> ) <sub>3</sub> COH	KCl	(CH <sub>3</sub> ) <sub>3</sub> COH	KCl
Cl	--	23.3*	18.2	8.1	39.0	4.2PP
	7.9	15.9	20.5	7.4	43.8	3.3
	9.4	14.6	--	7.1*	50.9	2.6
	10.5	13.3	--	6.7*	53.0	--*
	11.5	12.2	23.9	6.2	57.0	--*
	12.5	11.4	28.3	5.6	58.4	2.0
	16.5	9.0	33.3	4.8	67.3	1.4
			36.6	4.5	90.0	--*

The composition of the plait point, PP, at 25° is 4.5 gms. KCl and 41.0 gms. (CH<sub>3</sub>)<sub>3</sub>COH per 100 gms. sat. solution.  
(Ginnings, Herring and Webb, 1933)

DISTRIBUTION OF POTASSIUM CHLORIDE AT 17°  
(Wosnessensky, 1925)

<u>Water and Amyl Alcohol</u>			<u>Water and Phenol</u>		
Millimols KCl per liter		$\frac{C_1}{C_2^{1.32}}$	Millimols KCl per liter		$\frac{C_1}{C_2}$

921.140	1.648	477			

SOLUBILITY OF POTASSIUM CHLORIDE IN AQUEOUS ACETONE SOLUTIONS  
(Snell, 1898; at 20°; Herz and Knoch, 1904; see also Timmermans and Lewin, 1953)

Wt. (See note) Per cent Acetone in Solvent	At 20°		At 30°		At 40°		At 50°	
	KCl per 100 cc. Solution		Gms. per 100 gms. Solution		Gms. per 100 gms. Solution		Gms. per 100 gms. Solution	
	Millimols		Acetone		Acetone		Acetone	
	Gms.		KCl		KCl		KCl	
0	410.5	30.62	0	27.27	0	28.69	0	30
9.1	351.7	26.23	6.96	23.42	6.79	25.33	--	--
20	286.6	21.38	16.22	18.90	15.75	21.28	--	--
30	223.7	16.69	25.45	15.06	two layers		25.67	14.42
40	166.5	12.42	35.52	11.31	"		36.03	9.93
50	115.4	8.61	45.98	8.04	"		46.46	7.07
60	71.2	5.31	56.91	5.12	"		57.37	4.38
70	38.5	2.87	68.18	2.60	"		68.56	2.22
80	12.9	0.96	79.43	0.76	79.34	0.58	79.25	0.94
90	2	0.15	89.88	0.13	89.84	0.16	±81° sat. sol.	
100	0	0	100	0	100	0		

NOTE: For the 20° results, the per cent acetone in the solvent is in terms of volume instead of weight per cent, and the concentration of the second solution is 10 percent instead of 9.1 which is the weight percent concentration of the solvent for the corresponding results at the other temperatures.

At the temperature 40° and for concentrations of acetone between 20 and 80 percent, the saturated solution separates into two layers having the following compositions:

Lower Layer			Upper Layer		
Gms. per 100 gms. solution			Gms. per 100 gms. solution		
H <sub>2</sub> O	(CH <sub>3</sub> ) <sub>2</sub> CO	KCl	H <sub>2</sub> O	(CH <sub>3</sub> ) <sub>2</sub> CO	KCl
55.2	31.82	12.99	28.14	69.42	2.44
53.27	35.44	11.29	30.96	65.97	3.07
51.23	38.50	10.27	32.64	63.79	3.56
50.34	39.88	9.77	34.07	62.01	3.92
48.02	43.18	8.79	37.44	57.67	4.89
46.49	45.34	8.17	38.68	56.17	5.25
58.99	25.24	15.77	23.66	74.91	1.43

(Plait point approx. 50.5% acetone, 6.5% KCl)

Data for the systems KCl + n-propoxyethanol + H<sub>2</sub>O and KCl + iso-propoxyethanol + H<sub>2</sub>O are given by Timmermans and Lewin 1953.

## THE SYSTEM POTASSIUM CHLORIDE - SUCROSE - WATER AT 30° (Kelly, 1954; Kohler, 1897; Schukow, 1900)

All the results are summarized in the diagram by Kelly. The invariant point lies at 64.0% sucrose, 12.0% KCl.

SOLUBILITY OF KCl IN MANNITOL SOLUTIONS AT 25°  
(Armstrong and Eyre, 1913)

Solvent: Gms. Mannitol per 100 gms. H <sub>2</sub> O:	0.0	4.553	13.659
Sat. Sol.: Wt. % KCl:	26.89	24.86	24.46

EQUILIBRIUM IN THE SYSTEM POTASSIUM CHLORIDE - UREA - WATER  
(Polosin and Ozolin, 1947)

The system was also studied by Bochovkin and Bochovkina, 1947 with results which differ from those below. According to B. and B. the eutectic solution contains 15.9% KCl and 26.1% urea at -16.9°, and is in equilibrium with ice,  $\alpha$ -KCl and  $\gamma$ -urea. They found only  $\gamma$ -urea to be stable in mixtures which contained excess solid KCl. The results of Zhdanov and Nigai (1956a) at 25° are in reasonable agreement with those given below. [In the original, the results are also given in moles per 1000 moles of water and in moles per 100 moles of dissolved salts.]

100 cc. sat. sol. of potassium chloride in ethyl urethan (NH<sub>2</sub>COOC<sub>2</sub>H<sub>5</sub>) contain 0.105 gm. KCl at 60°. (Stuckgold, 1917)

A mixture of equal volumes of ethyl ether and water, when saturated with HCl at 0°, dissolves 0.056 gms. KCl per 100 gms. of mixture.  
(Fischer and Seidel, 1941)

SOLUBILITY OF KCl IN ACETALDEHYDE AND PARALDEHYDE SOLUTIONS AT 25°  
(Armstrong and Eyre, 1913)

	Solvent	Wt. % KCl in Sat. Sol.
Water alone	--	26.89
Acetaldehyde	1.101 gms./100 gms. H <sub>2</sub> O	27.05
Paraldehyde	1.101 "	26.42

100 gms. 95% formic acid dissolve 19.4 gms. KCl at 19.7°. (Achan, 1913)

SOLUBILITY OF POTASSIUM CHLORIDE IN VARIOUS ALCOHOLS

(Larson and Hunt, 1939; Zeitlin, 1926; Turner and Bissett, 1913; Caley and Axelrod, 1942; deBruyn, 1892; Rohland, 1898; Seward and Schumb, 1930; Pavlopoulos and Strehlow, 1954; Kato and Hagiwara, 1950; Ferner and Mellon, 1934; Akerlof and Turck, 1935; Herz and Anders, 1907; Barker and Ali, 1950)

The results of Kirn and Dunlap, 1931 show much smaller solubilities than these and are listed separately in the following table:

	Gms. KCl per 100 gms. of alcohol					
	10°	16°	18°	20°	25°	35°

C10 POTASSIUM CHLORATE  $KClO_3$ 

## SOLUBILITY OF POTASSIUM CHLORATE IN WATER

The results of Taylor, 1897; Carlson, 1910; Calzolari, 1912; Bronsted, 1913; Tschugneff and Chlopin, 1914; Toda, 1921, 1922; Iijinski, 1922; Noonan, 1948; Wright, 1927; DiCapua and Scalletti, 1927; Flottmann, 1928; Ricci, 1937, 1938; Nallet, 1955, and Ricci and Yanik, 1937, were plotted and the following average values read from the curve. The results above 100° are from Tilden and Shenstone, 1881; and Benrath, Gfedebo, Schiffers and Wunderlich, 1937. The solid phase is  $KClO_3$  in all cases.

## APPROXIMATE SOLUBILITY OF POTASSIUM CHLORATE IN POTASSIUM CARBONATE SOLUTIONS (Alekcceevsky, 1921)

The determinations were made by adding KClO<sub>3</sub> to the aqueous solvent until no more dissolved after a period of 3 hours. The curves drawn from the results are very irregular, thus showing that saturation could not have been reached in all cases.

THE SYSTEM POTASSIUM CHLORATE - SODIUM CHLORATE - WATER  
(Nallet, 1955; Nallet and Paris, 1956)

The older results of Muntner and Brown (1943), DiCapua and Scalletti (1927), and Iljinsky (1924) are scattered and less reliable. Data in molarities are given by Holluta and Peter (1929).

## SOLUBILITY OF POTASSIUM CHLORATE IN ORGANIC SOLVENTS AT 25° (Isbin and Kobe, 1945)

Solvent	Gms. KClO <sub>3</sub> per 100 gms. Solvent
Ethylenediamine	0.145
Monoethanolamine	0.30
Ethylene Glycol	1.21

100 gms. liquid ammonia (NH<sub>3</sub>) dissolve 2.52 gms. KClO<sub>3</sub> at 0°.  
(Hunt and Boncyk, 1933)

Melting points in the system KClO<sub>3</sub> + KNO<sub>3</sub> were determined by Palkin, 1948.

## C10 POTASSIUM PERCHLORATE KClO<sub>4</sub>

### SOLUBILITY OF POTASSIUM PERCHLORATE IN WATER

The following values were taken from an average curve constructed from the results of Pierrot, 1921; Hering, 1926; Willard and Smith, 1923; Moser and Ritschel, 1925; Bozarth, 1923; Flottmann, 1928; Cornec and Neumeister, 1929; Platt and Jordan, 1930, 1933; Akerlof and Turck, 1935; and Caven and Bryce, 1934. Above 100° Benrath, Gjedebø, Schiffers and Wunderlich, 1937.

The earlier results of Carlson, 1910; Rosenheim and Weinhaber, 1910-11; and Calzolari, 1912 are too high. Densities in parentheses are from this older work.

The solid phase is  $KClO_4$  throughout.

t°	d. of sat. sol.	Gms. $KClO_4$ per 100 gms. sat. sol.	t°	d. of sat. sol.	Gms. $KClO_4$ per 100 gms. sat. sol.	t°	Gms. $KClO_4$ per 100 gms. sat. sol.

Results at 25°  
(Greenberg and Walden, 1940)

The mixtures were heated, and equilibrium was approached from super-saturation. Equilibrium was attained in two weeks, providing the solid phase was ground in an agate mortar a few days after preparation, otherwise 1-1/2 months were required. The solid phases were analyzed by the wet residue method, and the lattice constants were determined by X-Ray analysis.

ClO

SOLUBILITY OF POTASSIUM PERCHLORATE IN VARIOUS SALT SOLUTIONS AT 25°  
(Bozorth, 1923)

Saturation was obtained by constant agitation, and approaching equilibrium from above and from below. The salt content of the solvents was determined by evaporation and drying the residue at 200°. The salt content of the saturated solutions was determined in the same manner and the difference ascribed to dissolve perchlorate.

## K KALIUM

SOLUBILITY OF POTASSIUM PERCHLORATE IN AQUEOUS ETHANOL SOLUTIONS  
(Pierrat, 1921)Results at 15°

Saturation was obtained by constant agitation for several hours. The saturated solution was evaporated to dryness in a current of air and the residue dissolved in enough water to yield the original volume of the solution. The salt content of this solution was then determined by electrolytic conductivity measurement.

## K. KALIUM

## Freezing point data:

The points were determined by adding a sat. solution of  $K_2Cr_2O_7$  successive 1 to 2 gm. portions of chromic acid and ascertaining the freezing-point and composition of the solution. At the point of appearance of a new solid phase an additional amount of chromic acid does not change the f.-pt. since the added  $CrO_3$  goes into the solid phase. This relation also holds at the points where the solution is simultaneously saturated with  $K_2Cr_2O_7$  and  $K_2Cr_2O_{10}$  or  $K_2Cr_2O_{10}$  and  $K_2Cr_4O_{13}$ .

The viscosity of the solutions at the lower temperatures increased so much that the cryohydrate points could not be determined. By graphic extrapolation the cryohydrate temperature of chromic acid and of chromic acid + potassium tetra-chromate is near -80° and the CrO<sub>3</sub> content is 59 gms. per 100 gms. sat. solution.

Data for boiling points in the system K<sub>2</sub>O + CrO<sub>3</sub>·H<sub>2</sub>O determined by means of the Beckmann apparatus are also given.

## SOLUBILITY OF POTASSIUM CHROMATE IN WATER

There has been considerable disagreement among the several determinations, perhaps caused by lack of control of the pH. The following table shows the magnitude of the variations which are encountered. Etard's data are consistently low and have been omitted from the average curve.

## A STUDY OF THE RECIPROCAL SALT PAIR [(NH<sub>4</sub>)<sub>2</sub>K<sub>2</sub>]-[CrO<sub>4</sub>,SO<sub>4</sub>] AT 25° (Ishikawa, 1926)

Previous experiments have shown that K<sub>2</sub>SO<sub>4</sub> + K<sub>2</sub>CrO<sub>4</sub> and also (NH<sub>4</sub>)<sub>2</sub>SO<sub>4</sub> + K<sub>2</sub>SO<sub>4</sub> each form a complete series of solid solutions with no gap, while (NH<sub>4</sub>)<sub>2</sub>CrO<sub>4</sub> + (NH<sub>4</sub>)<sub>2</sub>CrO<sub>4</sub> + K<sub>2</sub>CrO<sub>4</sub> each form a series of solid solutions with gaps respectively at 2.90 to 21.51 and 16.75 to 55.50 molar percentages of ammonium chromate. The present experiments were made by adding to a solution in equilibrium with two kinds of solid solutions of two salts having a common ion, another salt in different proportion, in such a manner that when equilibrium is attained, two or three solid phases remained as residue. The mixtures were rotated in a thermostat for at least two days. The results of the analyses are given in a table and plotted in the Janecke square diagram.

## THE SYSTEM POTASSIUM CHROMATE - SODIUM CHROMATE - WATER AT 25° (Makarov and Druzhinin, 1937)

The results are also reported on a mole basis.

CrO POTASSIUM DICHROMATE  $K_2Cr_2O_7$ 

## SOLUBILITY IN WATER

Averages of the very closely agreeing results of Sherrill and Eaton (1907), LeBlanc and Schmandt (1911), Greenish and Smith (1901), Koppell and Blumenthal (1907), Flottmann (1928), Rakowski (1931), Noonan (1948), Bogoyavlenskii (1949, 1952), Robertson (1924), Konopkina (1956). Above 60° there is less data, and the average of results of Alluard (1864), Kremens (1854), and Tilden and Shenstone (1884) is given. The data of Etard (1894) at higher temperatures are too low.

Results for the solubility of  $K_2Cr_2O_7$  in 27 mixtures of  $H_2O + D_2O$  are given by Chang and Chang (1955). The solubilities are:

- $$S_n = 0.5024 - 0.1467n + 0.0174n^2$$

where {  $S_n$  = moles  $K_2Cr_2O_7$  per 55.51 moles solvent  
 $n$  = mole fraction  $D_2O$  in solvent
- $$S_x = 0.1478 - 0.0540x + 0.0049x^2$$

where {  $S_x$  = gms.  $K_2Cr_2O_7$  per gm. solvent  
 $x$  = wt. fraction  $D_2O$  in solvent

A method for the determination of alcohol in unknown mixtures, based upon the above data, is described by the authors.

## K KALIUM

THE SYSTEM POTASSIUM FLUORIDE - PROPYL ALCOHOL - WATER AT 25-26°  
(Frankforter and Fray, 1913)

One tie line was determined. In this case the upper layer contained 78.91%  $C_3H_7OH$  and 0.31% KF, and the lower layer contained 9.67% KF.

In this system, the effect of change in temperature is more marked than in the preceding one in which ethyl alcohol is present.

## Points on the Binodal Curve

F	Gms. per 100 Gms. Homogeneous Liquid			Gms. per 100 Gms. Homogeneous Liquid

4.45	18.68	39.20	4.0
7.70	14.30	65.80	1.0 *
15.10	9.30		

THE SYSTEM POTASSIUM FLUORIDE - TERTIARY BUTYL ALCOHOL - WATER AT 30°  
(Ginnings and Robbins, 1930)

The points on the binodal curve of this system were determined by observing the appearance or disappearance of clouding in a mixture of weighed amounts of KF and one of the two liquids, upon addition of a weighed amount of the other. Conjugate points representing the lines \* located by determining KF in two liquid layers in contact with each other. The plait point, PP, was found by plotting.

Gms. per 100 gms. sat. sol.		Gms. per 100 gms. sat. sol.		Gms. per 100 gms. sat. sol.		F
(CH <sub>3</sub> ) <sub>3</sub> COH	KF	(CH <sub>3</sub> ) <sub>3</sub> COH	KF	(CH <sub>3</sub> ) <sub>3</sub> COH	KF

## K KALIUM

The reactions in the solid state below the melting points were studied for the following pairs of salts by Link and Wood, 1939.

KF + RbCl	KF + CsBr	KF + LiI
KF + RbBr	KF + CaI	KF + NaCl
KF + RbI	KF + LiCl	KF + NaBr
KF + CsCl	KF + LiBr	KF + NaI

## F POTASSIUM BERYLLIUM FLUORIDE $K_2BeF_4$

THE SYSTEM  $K_2BeF_4 - H_2O$   
(Vorob'eva and Tamm, 1956)

When an equimolar mixture of  $K_2CO_3$  and  $BeCH_2$  is dissolved in HF solution, colorless hexagonal prisms of  $K_2BeF_4$  precipitate. The salt dissolves slowly (20 hrs.), and then the concentration in solution slowly decreases over 2 months, indicating that the original phase was metastable.

t°	Gms. $K_2BeF_4$ per 100 gms. sat. sol.	Solid Phase	t°	Gms. $K_2BeF_4$ per 100 gms. sat. sol.	Solid Phase
-0.15	0.38	Ice	25	1.52	$K_2BeF_4$
-0.30	0.77	"		(1.97)*	"
-0.38	0.94	" + $K_2BeF_4$	50	2.42	"
0.0	1.04 (1.23)*	$K_2BeF_4$	75	3.36	"

\*metastable modification.

Phase equilibria in the system  $K_2BeF_4 - K_2SO_4$  were studied by Levina, Novoselova, Simanov, and Bakina, 1956.

## POTASSIUM GERMANIUM FLUORIDE $K_2GeF_6$

SOLUBILITY IN WATER

18°	100°		
173.98	34.07 gms. per 100 gms. $H_2O$		(Winkler, 1887)
184.61	38.76 " "	"	(Kruss and Nilson, 1887)

## POTASSIUM HAFNIUM FLUORIDE $K_2HfF_6$

100 gms. sat. solution of Potassium Hafnium Fluoride in Water contain 3.0 gms.  $K_2HfF_6$  at 20°. (v. Hevesy, 1923.)

## F POTASSIUM NIOBIUM FLUORIDES $K_2NbF_7$ , $KNbF_6$ , $K_2NbOF_5$

The System  $KNbF_6 - HF - H_2O$  AT 25°  
(Savchenko and Tansnaev, 1946)

Saturated Solution Wt. %		Solid Phase	Saturated Solution Wt. %		Solid Phase
HF	$KNbF_6$		HF	$KNbF_6$	
40.90	15.79	$KNbF_6$	54.00	15.14	$KNbF_6$

# K KALIUM

Some data for the quaternary systems  $K_2NbF_7 - KF - HF - H_2O$  and  $K_2NbF_7 - K_2TaF_7 - HF - H_2O$  at 25° are also given by Savchenko and Tananaev, 1946.

## SOLUBILITY OF $K_2NbOF_5 \cdot H_2O$ IN 1% HF SOLUTION (Meerson, Zverev, and Zubkova, 1939)

Temperature °	20	40	60	75
% $K_2NbOF_5 \cdot H_2O$ :	10	19	33	46

Data for the system  $K_2NbOF_5 \cdot H_2O - K_2TaF_7 - H_2O$  (+ 1% HF) at 20° and 60° are also given.

## F POTASSIUM PLATINUM FLUORIDE $K_2PtF_6$

At 25° 100 ml. sat. solution contains 0.750 gms.  $K_2PtF_6$ . (Wheeler, Perros and Naeser, 1955.)

## POTASSIUM TANTALUM FLUORIDES $K_2TaF_7$ , $KTaF_6$

### SOLUBILITY OF POTASSIUM TANTALUM FLUORIDE IN HYDROFLUORIC ACID SOLUTIONS

(The System  $K_2TaF_7 - HF - H_2O$ )

(Babaeva and Klatchko-Gourvitch, 1935 at 0°, 20°, 80°; Savchenko and Tananaev, 1946 at 25°, 1947 at 75°)

At high concentrations of HF the reaction  $2KTaF_6 \rightleftharpoons K_2TaF_7 + TaF_5$  proceeds to the left and the solid phase becomes  $KTaF_6$ . (The ratio  $KF:TaF_5$  in solution increases sharply.) At 25° for example, this occurs above 45.3% HF, and the new curve ( $KTaF_6$ ) was followed up to 69% HF.

EQUILIBRIUM IN THE SYSTEM POTASSIUM IODIDE - IODINE - WATER  
(Briggs, Glack, Ballard, and Sassaman, 1940)

See also Vol. I, p. 1257-9

The authors' data confirm the findings of Grace and of Foote and Chalker, which indicated the existence of two polyiodide compounds in the system. The older work of Parsons and Whittemore, who thought the system to be simple, is shown to have been incorrectly interpreted by those authors.

## K KALIUM

## THE SYSTEM POTASSIUM IODIDE - LEAD IODIDE - WATER

In the case of the determinations by Burrage, constant agitation in a thermostat was employed. At low concentration of  $\text{PbI}_2$  the lead was determined colorimetrically. For the determinations by Demassieux the solutions were simply shaken by hand several times a day and the temperature held constant to within  $0.5^\circ$ . Van Klooster and Balon, 1934 give data at  $25^\circ$  in excellent agreement with those of Burrage.

THE SYSTEM POTASSIUM IODIDE - t-BUTANOL - WATER AT 30°  
(Ginnings and Robbins, 1930)

The points of the binodal curve of this system were determined by observing the appearance or disappearance of clouding in mixtures of weighed amounts of KI in one of the liquids upon addition of weighed amounts of the other. Tie lines, \*, connecting conjugate points were located by determination of KI in liquid layers in contact with each other and from these the plait point, PP, was found by plotting.

# K KALIUM

## SOLUBILITY OF POTASSIUM IODIDE IN INORGANIC SOLVENTS

Solvent	t°	Solubility	Author
Ammonia (liq.)	0	184.2 gms. KI per 100 gms. NH <sub>3</sub>	(1)
	25	182.0 "	(2)
Sulfur dioxide (liq.)	0	41.3 gms. KI per 100 gms. SO <sub>2</sub>	(3)
	25	0.75 "	(4)
Data for equilibrium in the System KI + SO <sub>2</sub> are given by Walden and Centnerszwer, 1903. Results for the vapor pressure, temperature relations of the system are given by Foote and Fleischer, 1931.			
Phosphorus Oxychloride	20	1.71 gms KI per liter	(8)
I Hydrazine	18	0.250 moles KI per 100 moles sat. sol.	(5)
	Room	175 gms. KI per 100 cc. N <sub>2</sub> H <sub>4</sub>	(6)
Hydroxylamine	17.5	110 gms. KI per 100 gms. NH <sub>2</sub> OH	(7)
(1) Linhard and Stephen, 1933,	1934	(5) Semenchenko and Shakparonov,	1948
(2) Hunt,	1932	(6) Welsh and Broderson,	1915
(3) Jander and Ruppolt,	1937	(7) de Bruyn,	1892
(4) Shatenstein and Viktorov,	1937	(8) Gutmann,	1952

Melting points are given for:

KI + NaI	(Platonov, 1946; Nyankovskaya, 1956)
KI + K <sub>2</sub> SO <sub>4</sub>	(Ruff and Plato, 1903; Gromakov, 1951)
KI + AgI	(Sandoninni, 1912a)
KI + NaCl	(Ruff and Plato, 1903; Waxberg, 1930)
KI + PbI <sub>2</sub>	(van Klooster and Stearns, 1933)
KI + SO <sub>2</sub>	(Walden and Centnerszwer, 1903)
KI + MgI <sub>2</sub>	(Klemm, Beyersdorfer, and Oryschkewitsch, 1948)
KI + KIO <sub>3</sub>	(Bousquet and Dode, 1950)
KI + AgNO <sub>3</sub> = KNO <sub>3</sub> + AgI	(Dombrovskaya and Koloskova, 1953)
KI + NaF = KF + NaI	(Platonov, 1946; Dombrovskaya, 1950)
2KI + Na <sub>2</sub> SO <sub>4</sub> = K <sub>2</sub> SO <sub>4</sub> + 2NaI	(Nyankovskaya, 1956)
KI + ZnSO <sub>4</sub>	(Luzhnaya and Vereshchetina, 1954)

The reactions between the solids below their melting points were studied by Link and Wood, 1940 for the following pairs: KI + RbF, KI + CsF.

## POTASSIUM IODOMERCURATE (Thoulet Solution)

A sat. solution at 22.9°, prepared by adding KI and HgI<sub>2</sub> in excess to water, contained 8.66% K, 22.49% Hg, 52.58 (57.7)% I and 10.97 (11.15)% H<sub>2</sub>O, corresponding to 0.22 mol. alkali, 0.11 mol. Hg and 0.45 mol. I.  
(Duboin, 1905)

POTASSIUM IODATE  $\text{KIO}_3$ 

10

## SOLUBILITY OF POTASSIUM IODATE IN WATER

The results of Kremers, 1856(a); Meerburg, 1905; Flottman, 1928; Hill and Brown, 1931; Ricci, 1931; and Smith, 1947; above  $100^\circ$ , Benrath, Gjedebø, Schiffers and Wunderlich, 1937; were plotted and the following values taken from the average curve.

t°	d. of sat. sol.	Gms. $\text{KIO}_3$ per 100 gms. sat. sol.	t°	d. of sat. sol.	Gms. $\text{KIO}_3$ per 100 gms. sat. sol.	t°	d. of sat. sol.	Gms. $\text{KIO}_3$ per 100 gms. sat. sol.

## K KALIUM

Melting point data are given for:

### POTASSIUM CHROMIUM MOLYBDATE $3\text{K}_2\text{O} \cdot \text{Cr}_2\text{O}_3 \cdot 12\text{MoO}_3 \cdot 20\text{H}_2\text{O}$

At 17°, 2.5 gms. of the salt dissolve in 100 gms. H<sub>2</sub>O.  
(Jorgensen, 1879, 1884, 1890; Struve, 1899)

### MoO POTASSIUM PHOSPHOMOLYBDATE $\text{K}_3\text{PO}_4 \cdot 11\text{MoO}_3 \cdot 1\frac{1}{2}\text{H}_2\text{O}$

100 gms. H<sub>2</sub>O dissolve 0.0007 gm. at 30°.  
100 gms. aqueous 10% HNO<sub>3</sub> dissolve 0.204 gm. at 30°.  
(Donk, M. G., 1905)

#### SOLUBILITY OF POTASSIUM PHOSPHOMOLYBDATE IN AQUEOUS SOLUTIONS OF POTASSIUM NITRATE (Heidenhain, 1918)

In order to avoid errors due to impurities in the phosphomolybdate, small quantities of the washed precipitate were digested for a time long enough to insure saturation, and the dissolved part determined either by evaporation and weighing or by titration. The temperature is not stated.

POTASSIUM AZIDE  $\text{KN}_3$ 

N

SOLUBILITY OF POTASSIUM AZIDE IN WATER  
(Wohlgemuth, 1934)

The results are given in the form of a diagram but numerical values only for the following points.

t°	Gms. $\text{KN}_3$ per 100 gms. $\text{KN}_3 + \text{H}_2\text{O}$	Solid Phase
- 12.9 (Eutec.)	26.2	$\text{KN}_3 + \text{H}_2\text{O}$
0	29.3	$\text{KN}_3$
10.5	31.7*	"
15.5	32.8*	"
17.0	33.2*	"
100	51.4	"
354 (m. pt.)	100.0	"

\*The results at 10.5, 15.5 and 17.0 are by Curtius and Rissom, 1898.

SOLUBILITY OF POTASSIUM AZIDE IN ORGANIC SOLVENTS  
(Cranston and Livingstone, 1926)

100 gms. Alcohol ( $d_{17} = 0.799$ ) dissolve 0.16 gm.  $\text{KN}_3$  at 0° and 0.54 gm. at b. pt.

100 gms. Alcohol (80 per cent) dissolve 1.8 gm.  $\text{KN}_3$  at 0° and 5.9 gm. at b. pt.

100 gms. Benzene dissolve 0.15 gm.  $\text{KN}_3$  at b. pt.

POTASSIUM AMIDE  $\text{KNH}_2$ 

NH

100 gms. liquid ammonia dissolve 3.6 gms.  $\text{KNH}_2$  at 25°.  
(Hunt and Boncyk, 1933)

Data for the freezing-points of mixtures of potassium amide and sodium amide are given by Kraus, 1923.

Tetra POTASSIUM HYDRAZINE Tetra SULFONATE  
 $\text{K}_4[(\text{SO}_3)_2\text{N}-\text{N}(\text{SO}_3)_2]$ 

At 27° ( $\pm 1^\circ$ ), the solubility is 2.7 gms. per liter in water.  
(Grinstead, 1957)

# K KALIUM

## NO POTASSIUM NITRITE $\text{KNO}_2$

### SOLUBILITY IN WATER

(Ostwald, 1912, 1914; Rakowski and Slawina, 1931; also Nardelli, Cavalca and Braibanti, 1952; Voskresenskaya and Berul, 1954; Divers, 1899.)

The data of Bureau, 1935a, 1937 are too high. The data for the ice curve are those of Ostwald; those of Rakowski and Slawina agree. Bureau reports a pentahydrate,  $\text{KNO}_2 \cdot 5\text{H}_2\text{O}$  to be stable below  $-8.9^\circ$ . The values from  $-5$  to  $120^\circ$  were read from a plot of the various data.

Solid Phase ICE		Solid Phase $\text{KNO}_2$			
$t^\circ$	Gms. $\text{KNO}_2$ per 100 gms. sat. sol.	$t^\circ$	Gms. $\text{KNO}_2$ per 100 gms. sat. sol.	$t^\circ$	Gms. $\text{KNO}_2$ per 100 gms. sat. sol.

### THE SYSTEM POTASSIUM NITRITE - POTASSIUM NITRATE - WATER (Bureau, 1937)

Results in the form of a diagram are presented for the temperatures,  $0^\circ$ ,  $25^\circ$ ,  $56.6^\circ$  and  $98.5^\circ$  but numerical values are given only for the temperatures  $25^\circ$  and  $98.5^\circ$ .

Data for this system at  $0^\circ$ ,  $20^\circ$ ,  $40^\circ$ ,  $60^\circ$ ,  $80^\circ$  and  $98^\circ$  are also given by Rakowsky and Slavina, 1931, but the results are not in good accord with those below.

Results at $25^\circ$			Results at $98.5^\circ$		
Gms. per 100 gms. sat. sol.		Solid Phase	Gms. per 100 gms. sat. sol.		Solid Phase

19.90	18.75	"			

MC,  $\text{KNO}_2 + \text{KNO}_3$  = Mixed Crystals.

## K KALIUM

Melting point data are given for the following systems:

$\text{KNO}_2 + \text{KNO}_3$	(Meneghini, 1912; Berul and Bergman, 1952)
$\text{KNO}_2 + \text{NaNO}_2$	(Ettinger, 1932; Berul and Bergman, 1952)
$\text{KNO}_2 + \text{NaNO}_3 \rightleftharpoons \text{KNO}_3 + \text{NaNO}_2$	(Berul and Bergman, 1954)
$\text{KNO}_2 + \text{KOH}$	(Bergman and Reshetnikov, 1954)
$\text{KNO}_2 + \text{NaOH}$	(Bergman and Reshetnikov, 1954)
$\text{KNO}_2 + \text{Na acetate} \rightleftharpoons \text{K acetate} + \text{NaNO}_2$	(Bergman and Evdokimova, 1956)

## NO POTASSIUM NITRATE $\text{KNO}_3$

### SOLUBILITY IN WATER

Averages of the results of Mulder; Andrac, 1884; Gerardin, 1865; Etard, 1894; Ost., 1878; at 31.25°, Kohler, 1897; Euler, 1904; Tilden and Shenstone, 1884; Berkeley, 1904; Massink, 1917-18; Gladstone and Saunders, 1923; Wright, 1927; Malquori, 1928; Nikolajew, 1929; Benrath and Wazelle, 1929; Ehret, 1932; Muller, 1933; Ricci, 1934; and Saslowsky and Ettinger, 1935; Cornec and Krombach, 1929; Bergman and Nagory, 1938; Bergman and Botchkareff, 1938; Alexandrov, 1941; Thompson and Verner, 1948; and for temperatures above 100° by Berkeley, 1904; Bronsted, 1913; Aronowa and Lumskaia, 1931 and Benrath, Gjedebo, Schiffers and Wunderlich, 1937.

### SOLUBILITY OF $\text{KNO}_3$ IN DEUTERIUM OXIDE (Chang and Hsieh, 1949)

At 25° the molal solubility (moles per 55.51 moles of solvent) in  $\text{D}_2\text{O}$  is 0.912 x the solubility in  $\text{H}_2\text{O}$ .

SOLUBILITY OF POTASSIUM NITRATE IN WATER - HYDROGEN  
PEROXIDE MIXTURES  
(Floyd and Gross, 1955)

The data show a discontinuity at about 0.7 mole fraction  $H_2O_2$  in the solvent. The agreement with Akerlof and Turck, 1935 at 25° is good. The data were read from curves drawn by the authors through their experimental points.

Mole fraction $H_2O_2$ in solvent	Moles $KNO_3$ per 1000 gms. solvent			Mole fraction $H_2O_2$ in solvent	Moles $KNO_3$ per 1000 gms. solvent

THE SYSTEM POTASSIUM NITRATE - NITRIC ACID - WATER

(Engel, 1887 (0°); Kazantzov, 1923, 1925 (0°, 15°, 30°, 75°); Nikolajew, 1928 (25°); Nikolaev, Chirkov and Kogan, 1935 (-21°, 0°, 50°, 75°, 83°); Nichols, Howes et al., 1919 (20°))

Additional data are given by Groschuff, 1904. The data of Nichols, Howes, et al. are in error above 42%  $HNO_3$ . The results of Malquori, 1928c at 25° are much too high.

The data at 0° and 75° are those of Kazantzov, except as noted by superscripts. See the tables following for further data and invariant points.

The eutectic occurs at -3.8°; 7% KNO<sub>3</sub>, 9.3% KH<sub>2</sub>PO<sub>4</sub>.THE SYSTEM KNO<sub>3</sub> + NH<sub>4</sub>H<sub>2</sub>PO<sub>4</sub> = NH<sub>4</sub>NO<sub>3</sub> + KH<sub>2</sub>PO<sub>4</sub>  
(Bochkarev and Bergman, 1940; Bergman and Bochkarev, 1938)

The system was studied from -10° to the melting points of the salts, and the data are presented in weight and molar bases, and in many diagrams. Continuous solid solutions of KH<sub>2</sub>PO<sub>4</sub> + NH<sub>4</sub>H<sub>2</sub>PO<sub>4</sub> occupy the largest area of the diagram, and they become discontinuous as the KNO<sub>3</sub> field is approached. At higher temperatures the solid solutions become continuous at all concentrations. Some isothermal invariant points are given below:

Moles per 100 moles of Dissolved Salts						Solid Phase
t°	KH <sub>2</sub> PO <sub>4</sub>	NH <sub>4</sub> H <sub>2</sub> PO <sub>4</sub>	NH <sub>4</sub> NO <sub>3</sub>	KNO <sub>3</sub>	H <sub>2</sub> O

THE SYSTEM POTASSIUM NITRATE - POTASSIUM SULFATE - WATER  
(Hering, 1926, 1927)

Additional data at 35° are given by Massink (1916, 1917), and by Janecke (1929) at 0°, 25° and 50°.

The results at 310° are those of Benrath, 1943. At about 310°, the solubility curve of potassium sulfate in water exhibits a sharp change in slope, and the salt becomes less soluble upon increasing the temperature. Although the nature of the change has not been determined crystallographically, the break is sharp enough to be followed in the ternary system with added potassium nitrate. This maximum of the solubility of potassium sulfate was found to remain at 310° as the potassium nitrate is added.

## THE SYSTEM POTASSIUM NITRATE - AMMONIUM NITRATE - WATER

Very complete data for the complex system  $\text{KNO}_3 + \text{NH}_4\text{NO}_3 + \text{H}_2\text{O}$ , in which several modifications of the mix crystals (solid solutions) of the two salts are formed, are given by Janecke, 1928, and very much more complete results by Janecke, Hamacher and Rahlfs, 1932. These authors made more than 300 solubility determinations, including analyses of both the saturated solutions and solid phases. The results are presented in the form of tables of experimental determinations and diagrams which show the limits of composition and fields of existence of each of the several modifications of the mix crystals as well as the corresponding compositions of the saturated solutions at temperatures between -15° and +150°. Other data are given by Ando, 1925 and Caillart, 1918. The results reported by Bahl and Singh, 1940, and by Chand and Jain, 1945 do not represent equilibrium conditions.

The nature of the solid phases has been reexamined at 0° by Mukimov and Bergman, and by Karnaukhov 1956, 1957 at 25°. Karnaukhov reports a region of stability for the compound  $3\text{KNO}_3 \cdot \text{NH}_4\text{NO}_3$ .

NO

THE SYSTEM  $2\text{KNO}_3 + (\text{NH}_4)_2\text{SO}_4 \rightleftharpoons \text{K}_2\text{SO}_4 + 2\text{NH}_4\text{NO}_3 (+\text{H}_2\text{O})$  AT 25°  
(Osaka and Inouye, 1925)

Mixtures of the salts in roughly calculated proportions were rotated in a thermostat for several days, and both the saturated solutions and the solid phases were analyzed. There are five series of solid solutions present as solid phases. These are:

1.  $(\text{NH}_4, \text{K})_2\text{SO}_4$ ;
2.  $(\text{NH}_4, \text{K})_2(\text{NO}_3)_2 \alpha$ ;
3.  $(\text{NH}_4, \text{K})_2(\text{NO}_3)_2 \beta$ ;
4.  $(\text{NH}_4, \text{K})_2 0.5\text{SO}_4 0.5(\text{NO}_3)_2$ ;
5.  $(\text{NH}_4, \text{K})_2 0.4\text{SO}_4 0.6(\text{NO}_3)_2$ .

Complete tables showing the composition of the liquid and solid phases for each of the five series of solid solutions are given. The results are presented in gram percentages, and in molal proportion according to the formula

$$100m \text{ H}_2\text{O} \cdot x\text{K}_2 \cdot (100-x)(\text{NH}_4)_2y\text{SO}_4 \cdot (100-y)(\text{NO}_3)_2.$$

Additional data at various temperatures are given by Janecke, 1929.

Data for the mix crystals, solutions and melts in the System  $\text{KNO}_3 + \text{NH}_4\text{Cl}$   $\text{KCl} + \text{NH}_4\text{NO}_3$  are given by Janecke, 1928.

## THE SYSTEM POTASSIUM NITRATE - LEAD NITRATE - WATER

Recent physical chemical studies on solutions containing KNO<sub>3</sub> + Pb(NO<sub>3</sub>)<sub>2</sub> (Nayar and Pande, 1948; Vartak and Kabadi, 1955) seem to show molecular association compounds in solution. Vartak and Kabadi, 1957 claim to have isolated solids of corresponding compositions, but these were not found in the equilibrium phase studies, below.

P = Pb(NO<sub>3</sub>)<sub>2</sub>

K = KNO<sub>3</sub>

(Ehret, 1932)		(Gladstone and Saunders, 1923)						Solid Phase at each temp.

The system Potassium Nitrate - Urea - Water was studied by Polosin and Vasil'eva, 1956. The eutectic lies at  $-13.4^\circ$ , with the solution containing 31.60%  $\text{CO}(\text{NH}_2)_2$  and 5.50%  $\text{KNO}_3$ . Data up to  $+40^\circ$  are given.

100 gms.  $\text{H}_2\text{O}$  saturated with sugar and  $\text{KNO}_3$  dissolve 224.7 gms. sugar + 41.9 gms.  $\text{KNO}_3$ , or 100 gms. of the saturated solution contain 61.36 gms. sugar + 11.45 gms.  $\text{KNO}_3$  at  $31.25^\circ$ . (Kohler, 1897)

0.37 gms.  $\text{KNO}_3$  dissolve in 100 gms. of ethylenediamine at  $25^\circ$ .  
(Isbin and Kobe, 1945)

100 gms. trichlorethylene dissolve 0.01 gm.  $\text{KNO}_3$  at  $15^\circ$ .  
(Wester and Bruins, 1914)

100 cc. anhydrous hydrazine dissolve 14 gms. KNO<sub>3</sub> at room temperature.  
(Welsh and Broderson, 1915)

NO

Melting point data have been determined for the following:

KNO <sub>3</sub> + LiNO <sub>3</sub>	(Corveth, 1898; Harkins and Clark, 1915; Protsenko and Shelomov, 1953; Protsenko, 1952a)
KNO <sub>3</sub> + KOH	(Retortille and Moles, 1933; Bergman and Reshetnikov, 1954; Reshetnikov and Vilutis, 1958)
KNO <sub>3</sub> + NH <sub>4</sub> NO <sub>3</sub>	(Perman and Saunders, 1923; Janecke, 1928, 1949)
KNO <sub>3</sub> + NH <sub>4</sub> NO <sub>3</sub> + Pb(NO <sub>3</sub> ) <sub>2</sub>	(Glass, Laybourn and Madgin, 1932, 1933)
KNO <sub>3</sub> + NaNO <sub>3</sub>	(Kagan and Kamyschan, 1932; Janecke, 1942, 1949; Carvetti, 1898; Hissink, 1900; Quartaralli, 1920; Briscoe and Madgin, 1923; Glass, Labourn and Madgin, 1932, 1933; Palkin, 1949b; Kofler, 1955; Protsenko and Bergman, 1950)
KNO <sub>3</sub> + NaNO <sub>3</sub> + PbNO <sub>3</sub>	(Laybourn and Madgin, 1932)
KNO <sub>3</sub> + NaNO <sub>3</sub> + Sr(NO <sub>3</sub> ) <sub>2</sub>	(Harkins and Clark, 1915)
KNO <sub>3</sub> + Pb(NO <sub>3</sub> ) <sub>2</sub> + Pb <sub>3</sub> O <sub>4</sub>	(Freeman, Laybourn and Madgin, 1933)
KNO <sub>3</sub> + RbNO <sub>3</sub>	(Puschin and Rudoiic, 1937)
KNO <sub>3</sub> + Sr(NO <sub>3</sub> ) <sub>2</sub>	(Hawkins and Clark, 1915; Protsenko and Bergman, 1951; Gromakov and Gromakova, 1953)
KNO <sub>3</sub> + TlBr	(Rostkowski, 1929)
KNO <sub>3</sub> + TlNO <sub>3</sub>	(Van Eyk, 1899, 1905; Palkin, 1949b; Protsenko and Shelomov, 1953)
KNO <sub>3</sub> + NH <sub>4</sub> NO <sub>3</sub> + NaNO <sub>3</sub>	(Campbell and Campbell, 1947; Janecke, 1949)
KNO <sub>3</sub> + Mg(NO <sub>3</sub> ) <sub>2</sub>	(Janecke, 1942)
KNO <sub>3</sub> + Mg(NO <sub>3</sub> ) <sub>2</sub> + NaNO <sub>3</sub>	( " " )
KNO <sub>3</sub> + NaNO <sub>3</sub> + TlNO <sub>3</sub>	(Leman, 1940)
2KNO <sub>3</sub> + Tl <sub>2</sub> SO <sub>4</sub> = 2TlNO <sub>3</sub> + K <sub>2</sub> SO <sub>4</sub>	(Leman, 1940)
KNO <sub>3</sub> + K <sub>2</sub> SO <sub>4</sub> + Tl <sub>2</sub> Cl <sub>2</sub>	(Rostovskii, 1940)
2KNO <sub>3</sub> + Na <sub>2</sub> SO <sub>4</sub> = K <sub>2</sub> SO <sub>4</sub> + 2NaNO <sub>3</sub>	(Bergman and Wachsberg, 1947)
KNO <sub>3</sub> + Ca(NO <sub>3</sub> ) <sub>2</sub>	(Kitrov, 1947; Protsenko and Belova, 1957)
KNO <sub>3</sub> + NaNO <sub>2</sub> = KNO <sub>2</sub> + NaNO <sub>3</sub>	(Alexander and Hindin, 1947)
KNO <sub>3</sub> + N <sub>2</sub> H <sub>2</sub> ·HNO <sub>3</sub>	(Barlot and Marsaule, 1948)
KNO <sub>3</sub> + NaNO <sub>3</sub> + Sr(NO <sub>3</sub> ) <sub>2</sub>	(Protsenko and Bergman, 1951)
KNO <sub>3</sub> + NaClO <sub>3</sub>	(Platonov, 1946b)
KNO <sub>3</sub> + LiNO <sub>3</sub> + TlNO <sub>3</sub>	(Protsenko and Shelomov, 1953)
KNO <sub>3</sub> + LiOH = KOH + LiNO <sub>3</sub>	(Diogenov, 1951)
KNO <sub>3</sub> + Na acetate = K acetate + NaNO <sub>3</sub>	(Bergman and Evdokimova, 1956)
2KNO <sub>3</sub> + Ca(NO <sub>2</sub> ) <sub>2</sub> = 2KNO <sub>2</sub> + Ca(NO <sub>3</sub> ) <sub>2</sub>	(Protsenko and Belova, 1957)
2KNO <sub>3</sub> + Ba(NO <sub>2</sub> ) <sub>2</sub> = 2KNO <sub>2</sub> + Ba(NO <sub>3</sub> ) <sub>2</sub>	(Protsenko and Malakhova, 1957)
KNO <sub>3</sub> + K <sub>2</sub> WO <sub>4</sub>	(Kislova, Posypaiko and Bergman, 1955)
KNO <sub>3</sub> + NaOH	(Bergman and Reshetnikov, 1954; Reshetnikov and Vilutis, 1958)
KNO <sub>3</sub> + Na <sub>2</sub> SO <sub>4</sub> + Na <sub>2</sub> CrO <sub>4</sub>	(Rassonskaya and Bergman, 1953)

The temperatures at which  $\text{KNO}_3 + \text{TiBr}$  are completely immiscible, alone and with added salts, were determined by Semenchenko and Shaahkina, 1945.

Studies of the cryoscopy of various salts (up to 0.1 M) in molten  $\text{KNO}_3$  were made by Kordes, Bergman and Vogel, 1951.

# POTASSIUM NIOBATE $\text{KNbO}_3$

NbO

## SOLUBILITY IN WATER

(Lapitakii, Shishkina, Pchelkina, and Stepanov, 1955)

t°	Mg. per 100 ml. sat. sol.	Moles per liter
0	13.36	$7.4 \times 10^{-4}$
25	15.54	$8.7 \times 10^{-4}$
50	78.29	$4.4 \times 10^{-3}$
75	171.1	$9.5 \times 10^{-3}$
100	234.4	$1.3 \times 10^{-2}$

Melting points are given for:

$\text{KNbO}_3 + \text{NaNbO}_3$  (Reisman and Banks, 1958; Shirane, Newnham, and Pepinsky, 1954)  
 $\text{KNbO}_3 + \text{KTaO}_3$  ( " " " ; Reisman, Triebwasser, and Holtzberg, 1955)

# POTASSIUM TARTRATONIOBATE $\text{K}_2\text{O} \cdot \text{Nb}_2\text{O}_5 \cdot (\text{C}_2\text{H}_4\text{O}_5)_2 \cdot 10\text{H}_2\text{O}$

## SOLUBILITY IN WATER

(Srinivasan, 1950)

The salt dissolves slowly and forms supersaturated solutions readily. After 96 hours, the solubility became constant at 2.60 gms./100 gms.  $\text{H}_2\text{O}$  at 25°. Data at 5°, 35° and in alcohol and tartaric acid solutions are also given but do not represent equilibrium conditions.

## K KALIUM

## OH POTASSIUM HYDROXIDE KOH

THE SYSTEM KOH - H<sub>2</sub>O

The results of Pickering, 1893 and Holzi, 1937 are in reasonable agreement. Single determinations by Ferchland 1902 (15°), Akerlof and Short, 1937 (25°), de Waal, 1910 (30°) and Cohen-Adad, 1957 (0°, 30°) also agree. The isolated results of de Forcrand, 1909, Greenish and Smith, 1901, and Shibata, Oda, and Furukawa, 1932 are in error. Thermal analysis by Nizhnik and Lastochkina in the range 60-97° KOH revealed only the monohydrate as a stable phase. Cohen-Adad and Michaud, 1956 found a pentahydrate stable below the eutectic.

\*Melting point.

Data for the system KOH + NH<sub>3</sub> + H<sub>2</sub>O are given by Janecke, 1933(a). Weighed amounts of the three components were placed in small glass ampules which were then sealed. By warming or cooling these ampules, the upper and lower temperatures were determined at which a solid phase, two liquid layers or a combination of solid and liquid layers appeared or disappeared. The temperatures at which certain of the ampules exploded are also given.

Vuillard, 1957 studied this system by thermal analysis. An ice - dihydrate transition occurs at -98°, 32.9% NH<sub>3</sub>. A stable dihydrate - monohydrate eutectic occurs at -103.3°, 33.9% NH<sub>3</sub>.

THE SYSTEM POTASSIUM TARTRATE (*meso*) - POTASSIUM HYDROXIDE - WATER AT 17°  
(Peyronel, 1951)

T = tartrate A =  $K_2T \cdot 2H_2O$  B =  $K_2T \cdot KOH \cdot 3H_2O$  C =  $K_2T \cdot 2.5KOH \cdot 3H_2O$  D =  $KOH \cdot 2H_2O$

OH \*Negative on account of reaction  $\text{KOH} + \text{C}_2\text{H}_5\text{OH} \rightarrow \text{C}_2\text{H}_5\text{OK} + \text{H}_2\text{O}$ .

SOLUBILITY OF POTASSIUM HYDROXIDE IN AQUEOUS SOLUTIONS OF ACETONE AT 0°  
(Gibby, 1934)

The binodal curve was determined by titrating acetone into aqueous KOH solutions until a permanent separation into two layers occurred. Tie lines, \*, were located by means of mixtures which yielded sufficient amounts of the two layers to be used for titrating the KOH in each.

Data for the Systems KOH - acetone - water and KOH - pyridine - water at 25° are given in graphical form by Laurent and Duhamel, 1953.

Data for equilibrium in the system potassium hydroxide - phenol - water at 25° are given by van Meurs (1916).

Data for the system potassium tartrate - potassium hydroxide - ethanol - water at 18° are given by Peyronel and Venosta, 1952. The system forms two liquid phases and the compositions of several conjugate liquids are given.

THE SYSTEM POTASSIUM HYDROXIDE - UREA - WATER  
(Cohen-Adad, 1957)

# K KALIUM

## SOLUBILITY OF POTASSIUM HYDROXIDE IN METHYL ALCOHOL AND IN ETHYL ALCOHOL (Murray, 1929)

The mixtures were shaken occasionally during about three weeks.

t°	Solvent	Formula	d. of sat. sol.	Gms. KOH per 100		Normality of sat. sol.
				cc. sat. sol.	gms. sat. sol.	
28	Methyl Alcohol	CH <sub>3</sub> OH	1.14	40.3	35.5	7.19
28	Ethyl Alcohol	C <sub>2</sub> H <sub>5</sub> OH	1.04	29.0	27.9	5.17

## THE SYSTEM POTASSIUM HYDROXIDE - HYDRAZINE - WATER AT 50° (Penneman and Andrieth, 1949)

Gms. per 100 gms. Sat. sol.		Solid Phase	Gms. per 100 gms. sat. sol.		Solid Phase

30	9.69	65	22.49	100	38.30

\*Lange and Muller, 1930 report 0.432 moles/l at 22.5°, in agreement with the data above.

## POTASSIUM PHOSPHATES

PO

THE SYSTEM  $K_2O - P_2O_5 - H_2O$   
(Ravich, 1938a; Berg, 1938, 1938a)

The results of these authors are in good agreement. Earlier data are given by Janecke, 1927; D'Ans and Schreiner, 1910a; Parker, 1914. A review of the system is given by Wendrow and Kobe, 1954; Crystallographic data are given by Berg and Bokii, 1940. The results of Flatt, Brunisholz and Bourgeois, 1956 at 25° are similar to those listed.

0.02 gms. of  $K_2HPO_4$  are dissolved in 100 gms. of a saturated solution in furfural at 25° - Trimble, 1941.

PO POTASSIUM DIHYDROGEN PHOSPHATE  $KH_2PO_4$ SOLUBILITY OF  $KH_2PO_4$  IN WATER

The various results are in only fair agreement. The averages were read from a curve drawn through a plot of original data. Additional values are given by Janecke, 1927; Askenasy and Nessler, 1930 and Muthman and Kunze, 1894. Data by Polosin and Ozolin, 1940; Kuznetsov, Kozhukhovskii and Borovaya, 1948; and Zvorkin and Kuzetsov, 1938 are included in the average. Additional data are given by Bel'chev, 1953 and Sulaimankulov, Sharandina, Turdubaev and Fel'dsher, 1954.

Gms.  $KH_2PO_4$  per 100 gms. sat. sol.

Additional data for the solubility of mixtures of various Potassium and Ammonium Phosphates in Water at 0° and 25° are given by Janecke, 1927. Attention was directed particularly to the system  $\text{K}_3\text{PO}_4 + \text{NH}_4\text{H}_2\text{PO}_4 + \text{H}_2\text{O}$  in which the following solid phases occur at either 0° or 25°;  $\text{K}_3\text{PO}_4 \cdot 8\text{H}_2\text{O}$ ,  $\text{K}_2\text{HPO}_4$ ,  $(\text{NH}_4)_3\text{PO}_4 \cdot 3\text{H}_2\text{O}$ ,  $(\text{NH}_4)_2\text{HPO}_4$ ,  $\text{KH}_2\text{PO}_4$  and  $\text{NH}_4\text{H}_2\text{PO}_4$ . The determinations were made by the synthetic method. The solid phases were identified by the polarization microscope. Nine binary mixtures composed of the three potassium and three ammonium salts were studied. The results however are given in an abridged form chosen to show the most important features of the system.

## K KALIUM

### POTASSIUM METAPHOSPHATE $KPO_3$

Madorsky and Clark, 1940 produced potassium metaphosphate from the action of  $H_3PO_4$  on KCl at  $120^\circ-130^\circ$ . The product was washed to remove soluble impurities, and the solubility of  $KPO_3$  in water was found to be 0.0041 gms. per 100 ml. of saturated solution at  $25^\circ$ .

### PO POTASSIUM HYPOPHOSPHATE, HYPOPHOSPHITE

SOLUBILITY IN WATER  
(Salzer-Liebig's Ann. 211, 1, 82)

Salt	Formula	Gms. Salt per 100 gms. $H_2O$	
		Cold	Hot
Potassium Hypophosphate	$K_4P_2O_6 \cdot 8H_2O$	400	--
" Hydrogen Hypophosphate	$K_3HP_2O_6 \cdot 3H_2O$	200	--
" Di Hydrogen Hypophosphate	$K_2H_2P_2O_6 \cdot 3H_2O$	33	100

" Hydrogen Phosphite	$KH_2PO_3$	172 ( $20^\circ$ )	--
" Hypophosphite	$KH_2PO_2$	200 ( $25^\circ$ )	333
" Hypophosphite	$KH_2PO_2^*$	14.3 ( $25^\circ$ )	28

\*Solvent alcohol.

Melting points are given for the following:

$KPO_3 + LiPO_3$	(Bergman and Sholokhovich, 1953)
$KPO_3 + K_2SO_4$	( " " " )
$2KPO_3 + Li_2SO_4 \rightleftharpoons K_2SO_4 + 2LiPO_3$	( " " " )
	(Bergman, Kislova and Sholokhovich, 1953)
$KPO_3 + NaPO_3$	(Morey, 1954)
$KPO_3 + K_4P_2O_7$	(Morey, 1954)(Parravano and Calcagni, 1908, 1910)
$4KPO_3 + Na_4P_2O_7 \rightleftharpoons K_4P_2O_7 + 4NaPO_3$	(Morey, Boyd, Jr., England, and Chen, 1955)
$KPO_3 + Ba_2B_4O_7$	(Leontjewa, 1937)
$K_4P_2O_7 + K_3PO_4 + K_2TiO_3$	(Belyaev and Sigida, 1958a)
$K_4P_2O_7 + TiO_2 + K_2TiO_3$	( " " " )
$K_4P_2O_7 + 4LiTiO_3 \rightleftharpoons 4KTiO_3 + Li_4P_2O_7$	( " " " )
$K_4P_2O_7 + 2Na_2WO_4 \rightleftharpoons 2K_2WO_4 + Na_4P_2O_7$	(Sholokhovich and Bergman, 1954)
$K_4P_2O_7 + K_2SO_4$	(Bergman and Sholokhovich, 1954)
$K_4P_2O_7 + K_2CrO_4$	( " " " )
$K_4P_2O_7 + K_2MoO_4$	( " " " )
$K_4P_2O_7 + K_2WO_4$	( " " " )

### POTASSIUM PHOSPHOTUNGSTATE

1000 cc. sat. solution of potassium phosphotungstate in water contain 0.135 gm. of the compound at  $20^\circ$ . (Moser and Ritschel, 1925)

POTASSIUM BROMO PERRHENATE  $K_2ReBr_6$   
 POTASSIUM CHLORO PERRHENATE  $K_2ReCl_6$

RESULTS OF RULFS AND MEYER, 1955:

Salt	Solvent	Temp.	Solubility	
			Moles per liter	Gms. per liter
KReBr <sub>6</sub>	3.0 N HBr	25°	0.144	107
KReCl <sub>6</sub>	0.01 N HCl	25°	0.175	83.3

POTASSIUM PERRHENATE  $KReO_4$

ReO

SOLUBILITY OF POTASSIUM PERRHENATE IN WATER  
 (Holemann and Kleese, 1938)

The previous determinations, at temperatures up to 100°, by Puschin and Kovac, 1931; Lewino, Noddack and Noddack, 1931; and Roth and Becker, 1932, although varying among themselves, given when plotted, average values which agree closely with the present very careful determinations. The determinations above 100° were made by the synthetic method. The solid phase is  $KReO_4$  in all cases.

t°	d. of sat. solution	Gms. $KReO_4$ per 100 gms. sat. sol.	t°	Gms. $KReO_4$ per 100 gms. sat. sol.

\*Smith, 1946

Data for the partition of potassium perrhenate between nitromethane and water at 25° are given by Friedman and Haugen, 1954, 1956.

1 liter 89.7 Wt. percent Ethyl Alcohol,  $C_2H_5OH$ , dissolve 0.302 gm.  $KReO_4$  at 18.5°. (Tollert, 1932)

POTASSIUM SULFIDE  $K_2S$

S

Fusion-point data are given for the following systems:

$K_2S + K_2SO_4$  (Garibeu, Kolb and Kroll, 1938)  
 $K_2S + S$  (Thomas and Rule, 1917; Pearson and Robinson, 1931)

# K KALIUM

## 50 POTASSIUM SULFITE $K_2SO_3$

### SOLUBILITY OF POTASSIUM SULFITE IN WATER

The results of Foerster, Brosche and Norberg-Schultz, 1924 show a solubility nearly independent of temperature. Holz1's (1937) data indicate a steady increase up to 100°. F, B and N.S. made their determinations in an atmosphere of hydrogen.

SO POTASSIUM SULFATE  $K_2SO_4$ 

## SOLUBILITY OF POTASSIUM SULFATE IN WATER

The very closely agreeing determinations of Caven and Johnston, 1927, 1928; Wright, 1927; Flottmann, 1928; Blasdale, 1923; Hill and Moskowitz, 1929; Starrs and Storck, 1930; Malhorta and Suri, 1930; Benrath and Wazelle, 1929; Babajewa, 1913; Rakowski and Babajewa, 1931; Schroeder and Schlackmann, 1934; Mulder, 1864; Andrae, 1884; Trevor, 1891; Tilden and Shenstone 1884; Berkeley, 1904; Anosov and Byzova, 1947; and Benrath, Gjedebø, Schiffers and Wunderlich, 1937 (over 100°) were plotted, and values read from the curve. The monohydrate was found by Shulgina, Khar-chuk and Yanat'eva, 1950, 1955, and the results below 10° are by these authors.

Data for the Solubility of Potassium Sulfate in Water at 25° and under pressures up to 10,000 bars (metric atmospheres) are given by Adams, 1932.

At 500°, 400 bars 0.002 wt. %  $K_2SO_4$  dissolves in steam.  
(Ellis and Fyfe, 1957)

THE SYSTEM POTASSIUM SULFATE - WATER - HYDROGEN PEROXIDE AT 20°  
(Pani and Terrey, 1955)

Only pure  $K_2SO_4$  exists as the solid phase.

THE SYSTEM POTASSIUM SULFATE - LITHIUM SULFATE - WATER  
(Druzhinin and Yanko, 1954; Yanko and Druzhinin, 1955; Campbell  
and Kartzmark, 1958)

Druzhinin and Yanko studied the system at 0, 25, and 50° and found the double salt  $K_2SO_4 \cdot Li_2SO_4$  at each temperature. This salt forms limited solid solutions with  $Li_2SO_4$  (2% at 25°), and the limits of the solid solutions expand with increasing temperature. Campbell and Kartzmark thought the double salt solid to be "pure", but their tie-line data also show some solid solutions. C. and K. were apparently unaware of the earlier results.

Some results for solutions saturated with two solids at 20°, 60°, 98° are given by Spielrein, 1913, but they do not seem to be in very good agreement with those given below.

## THE SYSTEM POTASSIUM SULFATE - MAGNESIUM SULFATE - WATER

Bozza, 1934, also gives a compilation with diagrams of the available data upon this system at temperatures between 0° and 100° calculated to the terms proposed by Janecke. Additional data are given by Weston, 1922; Levi, 1923; Tabler, 1855 and others. Results at the freezing points are given by Fialkov and Chernogorenko, 1956.

### Results at 100°

At 100° this system was also studied by Campbell, Downs and Samis, 1934, but their results give a curve which differs considerably from that of Benrath and of Starrs and Storck. Their values for the triple points are shown in parentheses.

## Results of Yanat'eva and Orlova, 1956 at 55°

A "new phase" was found which appears to be a solid solution of molar ratio  $K_2SO_4/Na_2SO_4 > 3, < 3.6$ . (Glaserite  $\leq 3.0$ )

Gms. per 100 gms. sat. sol.			Solid Phase	SO
$Na_2SO_4$	$K_2SO_4$	$MgSO_4$		
5.60	14.30	--	$K_2SO_4 + G$	
28.95	6.20	--	$Na_2SO_4 + G$	
23.49	--	12.93	$Na_2SO_4 + A$	
5.37	--	33.66	$MgSO_4 \cdot 6H_2O + A$	
--	4.25	34.06	$MgSO_4 \cdot 6H_2O + L$	
--	14.05	17.97	$K_2SO_4 + L$	
4.94	13.91	3.40	$K_2SO_4 + G$	
4.33	13.30	7.53	" + "	
4.21	13.17	14.60	" + "	
4.05	12.96	15.64	$K_2SO_4 + G + L$	
9.57	8.55	19.55	$G + L$	
12.61	7.12	20.25	$G + L + A$	
17.40	6.58	15.75	$G + A$	
17.74	6.52	14.81	" + "	
21.45	6.11	12.40	$G + Na_2SO_4 + A$	
22.15	6.02	10.58	$G + Na_2SO_4$	
26.80	6.30	3.39	" + "	
8.86	5.70	25.30	$A + L$	
4.80	3.68	31.65	$A + L + MgSO_4 \cdot 6H_2O$	

A = Astrakanite =  $MgSO_4 \cdot Na_2SO_4 \cdot 4H_2O$

G = Glaserite =  $Na_2SO_4 \cdot 3K_2SO_4$

S = Schonite =  $MgSO_4 \cdot K_2SO_4 \cdot 6H_2O$

L = Leonite =  $K_2SO_4 \cdot MgSO_4 \cdot 4H_2O$

Data are given for the reciprocal salt pair  $K_2SO_4 + Mg(NO_3)_2 \rightleftharpoons MgSO_4 + K_2(NO_3)_2$  at 0° and 99.5°, Benrath and Benrath, 1930; at 25° and 50°, Benrath and Benrath, 1929a; at 75°, Benrath and Sichelschmidt, 1931.

Data for the system  $K_2SO_4 + MgCl_2 \rightleftharpoons 2KCl + MgSO_4 (+ H_2O)$  at 100° are given by Campbell, Downes, and Samis, 1934.

Weston, 1922 gives complete data for the quaternary system  $(NH_4)_2SO_4 + MgSO_4 + K_2SO_4 + H_2O$ . The results are expressed in terms of the  $H_2O$  required for the solution of 100 gm. quantities of various mixtures of the three salts.

## K KALIUM

THE SYSTEM  $K_2SO_4 - (NH_4)_2SO_4 - Na_2SO_4 - H_2O$  AT  $0^\circ$ ,  $25^\circ$ ,  $40^\circ$   
(Belopolsky and Shpunt, 1945)

$\gamma$ -Glaserite =  $K_3Na(SO_4)_2$  forming solid solutions with  $Na_2SO_4$ .  
 $(K, NH_4)_2SO_4$  = Continuous solid solutions of  $K_2SO_4$  +  $(NH_4)_2SO_4$ .

Data on the system  $K_2SO_4 + 2NH_4NO_3 \rightleftharpoons 2KNO_3 + (NH_4)_2SO_4 (+H_2O)$  at  $0^\circ$ ,  $25^\circ$ ,  $50^\circ$  are given by Janecke, 1929.

Data on the system  $K_2SO_4 + (NH_4)_2CrO_4 \rightleftharpoons K_2CrO_4 + (NH_4)_2SO_4 (+H_2O)$  are given by Ishikawa, 1926.

### THE SYSTEM POTASSIUM SULFATE - SODIUM SULFATE - WATER

The system has been studied by a large number of investigators, with good agreement among the results. The double salt glaserite,  $(3K_2SO_4 \cdot Na_2SO_4)$  is stable at all temperatures above  $1.8^\circ$ . This double salt forms solid solutions with  $Na_2SO_4$  but not with  $K_2SO_4$ . Recent work of Yanat'eva and Orlova (1956) indicates that above  $35^\circ$  glaserite may also form solid solutions with  $K_2SO_4$ . The following diagram is adapted SO from the composite drawn by these authors:

1 = ice    2 =  $K_2SO_4$     3 = Solid solution ( $3:1 + K_2SO_4$ )    4 = Glaserite ( $3:1 + Na_2SO_4$ )  
 5 =  $Na_2SO_4 \cdot 10H_2O$     6 =  $Na_2SO_4$

# K KALIUM

Extensive data at various temperatures are given by Blasdale, 1923; Teeple, 1929; Cornec and Krombach, 1928, 1929; D'ans, 1915; Amadori, 1920; and Okada, 1914 and others. The results given below are typical of the values obtained:

Data of Cornec and Krombach, 1928, 1929 at various temperatures:

t°	d. of sat. sol.	Gms. per 100 gms. sat. solution		Solid Phase
		Na <sub>2</sub> SO <sub>4</sub>	K <sub>2</sub> SO <sub>4</sub>

1.9260	9.30	6.72	83.68	$NaHSO_4 \cdot KHSO_4 \cdot 2H_2SO_4$

Cornec and Krombach, 1928, 1929 give data for equilibrium in water, including densities, of potassium and sodium sulfates and nitrates at  $50^\circ$  to  $90^\circ$ .

Complete experimental data for equilibrium in aqueous solutions of mixtures of potassium and sodium sulfates, nitrates and chlorides (including densities) at temperatures between  $0^\circ$  and  $90^\circ$  are given by Cornec and Krombach, 1929 and Cornec, Krombach and Spack, 1930. These authors have made use, whenever necessary, of the results for ternary and quaternary systems previously reported from their own laboratory or by others, including Cretien, 1929; Cornec and Hering, 1925-7; Cornec and Krombach, 1929; Meyerhoffer and Saunders, 1899; d'Ans, 1915 and Blasdale, 1918.

Data for the system  $K_2SO_4 + Na_2SO_4 + K_2CO_3 + Na_2CO_3(+H_2O)$  at  $35^\circ$ ,  $50^\circ$  and  $75^\circ$  are given by Teeple, 1929.

## 50 POTASSIUM NEODYMIUM SULFATE $KNd(SO_4)_2$

100 gms.  $H_2O$  sat. with Potassium Neodymium Sulfate,  $KNd(SO_4)_2 \cdot H_2O$ , contain 1.7 gm.  $KNd(SO_4)_2$  at  $0^\circ$  and 1.3 gms. at  $20^\circ$ . (Meyer and Kittlemann, 1931).

## POTASSIUM ETHYL SULFATE $KC_2H_5 \cdot SO_4$ $\alpha$ and $\beta$ forms

SOLUBILITY OF POTASSIUM ETHYL SULFATE IN WATER  
(Hammick and Mullaby, 1921)

This compound is dimorphous. On crystallizing from methyl alcohol or water there first appear tufts of long feathery crystals which redissolve as the solution cools and give place to the ordinary foliated form. Analysis showed no difference in composition between the two forms. The temperatures were determined at which the edges of crystals, present in synthetic mixtures contained in sealed tubes, changed from rounded to sharp or vice versa. No matter at what temperature crystallization

occurred the unstable  $\beta$  form was always the first to separate. It was easy to distinguish which solid phase was present at the different temperatures. The transition point was found to be at  $51.8^\circ$ . The ice curve was determined by the freezing-point method.

\*Gms. per 100 cc. soln. (Saunders, 1922).

## SO POTASSIUM PERSULFATE $K_2S_2O_8$

SOLUBILITY IN WATER  
(Tarugi, 1904)

The results in parentheses are the averages of a large number of determinations by Pajetta (1906). This investigator employed constant agitation for various lengths of time. Tarugi approached equilibrium from above as well as below but stirred the solutions only at intervals. The determination of the dissolved persulfate was made by boiling a measured volume of the clear saturated solution for 20 min. and titrating the  $H_2SO_4$  liberated, according to the equation  $K_2S_2O_8 + H_2O = K_2SO_4 + H_2SO_4$ . Tarugi also reports that the presence of a number of sodium and other salts in solution, does not appreciably alter the solubility of  $K_2S_2O_8$  in water.

t°	Gms. $K_2S_2O_8$ per 100 cc. Sat. Sol.	t°	Gms. $K_2S_2O_8$ per 100 cc. Sat. Sol.	t°	Gms. $K_2S_2O_8$ per 100 cc. Sat. Sol.

THE SYSTEM POTASSIUM TRITHIONATE - POTASSIUM PENTATHIONATE - WATER  
(Kurtenacker and Fluss, 1933)

t°	Gms. per 100 gms. sat. sol.		Phase	t°	Gms. per 100 gms. sat. sol.		Solid Phase
	K <sub>2</sub> S <sub>3</sub> O <sub>6</sub>	K <sub>2</sub> S <sub>5</sub> O <sub>6</sub>			K <sub>2</sub> S <sub>3</sub> O <sub>6</sub>	K <sub>2</sub> S <sub>5</sub> O <sub>6</sub>	
0	7.6	2.87	K <sub>2</sub> S <sub>3</sub> O <sub>6</sub> + K <sub>2</sub> S <sub>5</sub> O <sub>6</sub> · 1½H <sub>2</sub> O + S	20	10.84	9.98	K <sub>2</sub> S <sub>3</sub> O <sub>6</sub> + S
20	6.35	7.20	K <sub>2</sub> S <sub>5</sub> O <sub>6</sub> · 1½H <sub>2</sub> O + S	"	14.04	3.74	"
"	8.13	8.17	"	"	14.12	4.37	"
"	10.50	8.72	" + K <sub>2</sub> S <sub>3</sub> O <sub>6</sub> + S	"	14.99	2.46	"

High accuracy is not claimed for the above results since the polythionates begin to decompose after short periods of shaking.

POTASSIUM SULFAMATE KSO<sub>3</sub>NH<sub>2</sub>

SON

SOLUBILITY OF POTASSIUM SULFAMATE IN WATER  
(Ricci and Selikson, 1947, 1952)

t°	Gms. KSO <sub>3</sub> NH <sub>2</sub> per 100 gms. sat. sol.	Density	Solid Phase
9	31.44	1.222	KSO <sub>3</sub> NH <sub>2</sub>
20	40.05	--	"
25	43.73	1.327	"
35	50.38	--	"
45	56.40	--	"

Data for the system Potassium Sulfate - Potassium Sulfamate - Water at 25° are given by Ricci and Selikson, 1952. The system forms neither compounds nor solid solutions. The invariant solution contains 2.17% K<sub>2</sub>SO<sub>4</sub>, 42.03% KSO<sub>3</sub>NH<sub>2</sub> and has a density of 1.335. Both solids are anhydrous.

THE SYSTEM POTASSIUM SULFAMATE - AMMONIUM SULFAMATE - WATER  
(Ricci and Selikson, 1952)

The system was studied in detail at all three temperatures. Limited solid solutions of Roozebooms type 5 are formed.

0.00	56.40		100	KSO <sub>3</sub> NH <sub>2</sub>

\*region of minimum water content.

Results for the system  $2\text{KSO}_3\text{NH}_2 + (\text{NH}_4)_2\text{SO}_4 \rightleftharpoons \text{K}_2\text{SO}_4 + 2\text{NH}_4\text{SO}_3\text{NH}_2 (+\text{H}_2\text{O})$  at 25° are given by Ricci and Selikson, 1952. Since  $\text{K}_2\text{SO}_4$  and  $(\text{NH}_4)_2\text{SO}_4$  form continuous solid solutions, there is only one invariant point in equilibrium with 3 solid solutions.

## K KALIUM

SeO POTASSIUM SELENATE  $K_2SeO_4$ 

## SOLUBILITY IN WATER

The results of Etard, 1894 and of Meyer and Aulich, 1928 agree. Those of Friend, 1929 average about 1% higher at all temperatures. (Friend shook the mixtures for 2 hours - Meyer and Aulich for 4 to 6 hours). Individual determinations of other workers at 20°, 25° lie between the earlier values. The following values were taken from cruves drawn through the original results.

t°	Gms. $K_2SeO_4$ per 100 gms. sat. sol.			t°	Gms. $K_2SeO_4$ per 100 gms. sat. sol.

## SOLUBILITY OF POTASSIUM FLUOSILICATE IN SATURATED $\text{KNO}_3$ AND $\text{KCl}$ SOLUTION (Wassilieff and Martinoff, 1935)

The determinations were made at room temperature, about  $17^\circ$ . The mixtures were frequently shaken during several hours and then allowed to stand overnight. The dissolved  $\text{K}_2\text{SiF}_6$  was determined by titration with 0.1 n  $\text{NaOH}$  using phenolphthaline as indicator, bringing the solution nearly to the boiling point at the end of the titration.

Solvent	Gms. $\text{K}_2\text{SiF}_6$ per 100 cc. sat. sol.
Water	0.1147
Aq. Sat. $\text{KNO}_3$ Solution	0.0048
Aq. Sat. $\text{KCl}$ Solution	0.0048

(Sholokhovich and Bergman, 1954)

## KRYPTON Kr

SOLUBILITY IN WATER  
(Morrison and Johnstone, 1954)

Two separate samples of purified gas were used and temperatures were chosen randomly. The precision of the results is excellent. The data are 5-10% lower than those of von Antropoff, 1919, which are given for comparison.

$\beta$  = cc. of krypton (at N.T.P.) dissolved by 1 gm.  $H_2O$  when the partial pressure of the gas is 1 atm.

# LANTHANUM La

The solid-liquid equilibria of the systems krypton+argon and krypton + methane were determined by Veith (1937) from melting point curves.

The liquid-vapor data for the system krypton+oxygen were determined by Fastovskii and Gurvich, 1939. Other data are given by von Stackelberg, 1934.

## LANTHANUM La

### SOLUBILITY OF LANTHANUM IN MERCURY (Parks and Campanella, 1936)

Amalgams of lanthanum and mercury were prepared by heating the mixed constituents in fused quartz flasks to 200° or by electrolysis of Lanthanum Salts dissolved in absolute ethyl alcohol with Hg as the cathode. Such amalgams were kept in evacuated fused quartz flasks at the selected temperatures, approaching equilibrium from above and below. A filtered portion of the saturated solution was allowed to stand in contact with the air until the lanthanum had separated as the hydroxide and this was then determined by titration.

LANTHANUM SORBATE ( $\text{CH}_3\text{CH} = \text{CHCH} = \text{CHCOO}$ )<sub>3</sub>La

The solubility in water at 20° is  $2.779 \times 10^{-3}$  gm. moles per liter.  
(Bergamini, 1949)

LANTHANUM SALICYLATE	(o-HOC <sub>6</sub> H <sub>4</sub> COO) <sub>3</sub> La
3,5-DINITROBENZOATE	(3,5(NO <sub>2</sub> ) <sub>2</sub> C <sub>6</sub> H <sub>3</sub> COO) <sub>3</sub> La
CINNAMATE	(C <sub>6</sub> H <sub>5</sub> CH = CHCOO) <sub>3</sub> La

Data for the extraction of  $\text{La}^{+++}$  from  $\text{H}_2\text{O}$  by methyl isobutyl ketone and by chloroform at 25° ( $\mu = 0.1\text{M NaClO}_4$ ) in the presence of salicylic, 3,5-dinitrobenzoic and cinnamic acids are reported by Hok-Bernstrom, 1956.

# La LANTHANUM

## CH LANTHANUM CUPFERRATE (C<sub>6</sub>H<sub>5</sub>N(NO)O)<sub>3</sub>La

### SOLUBILITIES AT 25° FROM PARTITION EXPERIMENTS

Solvent	Solubility	
Chloroform	5.6 x 10 <sup>-4</sup> molee/liter	
Hexone	4 x 10 <sup>-4</sup> "	(Dyrssen and Dahlberg, 1953)

## LANTHANUM CAMPHOR 10-SULFONATE (C<sub>10</sub>H<sub>15</sub>OSO<sub>3</sub>)<sub>3</sub>La

The solubility in water at room temperature is 17.30 wt. %.  
(Pirrone, 1942)

## CN LANTHANUM CobalticyANIDE La[Co(CN)<sub>6</sub>].4.5H<sub>2</sub>O

### SOLUBILITY IN VARIOUS AQUEOUS SOLUTIONS AT 20° (Gross and Kahn, 1955)

m = added substance, s = La[Co(CN)<sub>6</sub>].4.5H<sub>2</sub>O, both in moles per liter.

SOLUBILITY OF LANTHANUM CHLORIDE AND OF LANTHANUM OXIDE IN AQUEOUS  
SOLUTIONS OF AMMONIUM CHLORIDE AT  $15^\circ$ ,  $30^\circ$ ,  $50^\circ$  and  $100^\circ$   
(Prandtl and Rauchenberger, 1920)

The results are given only in the form of small scale diagrams and it is stated that the numerical data will be published in full in the dissertation of Johanna Rauchenberger, University of Munchen, 1920. The equilibrium

was approached by the authors from both sides. The composition of the basic chlorides obtained by shaking the oxide with 1.0 N  $\text{NH}_4\text{Cl}$  at different temperatures, and drying over soda lime, was approximately as follows:

At  $15^\circ$ ,  $\text{La}_4\text{Cl}_2\text{O}_5 \cdot 9\text{H}_2\text{O}$ ; at  $30^\circ$ ,  $\text{La}_3\text{ClO}_4 \cdot 6\text{H}_2\text{O}$ ; at  $50^\circ$ ,  $\text{La}_8\text{Cl}_2\text{O}_{11} \cdot 16\text{H}_2\text{O}$ .

## La LANTHANUM

### ClO LANTHANUM Hexa Antipyrine PERCHLORATE $[\text{La}(\text{COC}_{10}\text{H}_{12}\text{N}_2)_6](\text{ClO}_4)_3$

100 cc. sat. solution of Lanthanum Hexa Antipyrine Perchlorate in Water contain 1.48 gm.  $[\text{La}(\text{COC}_{10}\text{H}_{12}\text{N}_2)_6](\text{ClO}_4)_3$  at 20°. (Wilke-Dorfurt and Schliephake, 1928)

### CrO LANTHANUM CHROMATE $\text{La}_2(\text{CrO}_4)_3 \cdot 8\text{H}_2\text{O}$

100 gms. sat. solution of Lanthanum Chromate in Water contain 0.020 gm.  $\text{La}_2(\text{Cr}_2\text{O}_4)_3$  at 25°. (Britton, 1924)

The system  $\text{La}_2(\text{CrO}_4)_3 + \text{K}_2\text{CrO}_4 + \text{H}_2\text{O}$  at 25° was studied by Carobbi, 1924, but the table of results does not show the quantity of  $\text{La}_2(\text{CrO}_4)_3$  present in the solutions. The results show the several double compounds formed.

### F LANTHANUM FLUORIDE $\text{LaF}_3$

3%  $\text{HNO}_3$  solution saturated with  $\text{LaF}_3$  at 100° contains 0.94 mg. La per ml. (Khlopin and Merkulova, 1950)

Melting points in the systems  $\text{LaF}_3 + \text{NaF}$ ,  $\text{LaF}_3 + \text{KF}$ ,  $\text{LaF}_3 + \text{RbF}$  and  $\text{LaF}_3 + \text{CsF}$  are given by Dergunov, 1948.

### I LANTHANUM Hexa Antipyrine IODIDE $[\text{La}(\text{COC}_{10}\text{H}_{12}\text{N}_2)_6]\text{I}_3$

100 cc. sat. solution of Lanthanum Hexa Antipyrine Iodide in Water contain 29.50 gm.  $\text{La}(\text{COC}_{10}\text{H}_{12}\text{N}_2)_6 \text{I}_3$  at 20°. (Wilke-Dorfurt and Schliephake, 1928)

### IO LANTHANUM IODATE $\text{La}(\text{IO}_3)_3$

#### SOLUBILITY IN WATER

The solubility apparently depends on the particle size of the samples.

t°	Solubility	Author
25	0.000893 moles = 0.593 gms./liter	(1)
25	0.000883 moles = 0.586 "	(2)
25	0.0006634 " = 0.441 gms./liter sat. sol. d = 0.99749	(3)
25	0.6842 gms./1000 gms. $\text{H}_2\text{O}$ , $d_{25}^4 = 0.99825$	(4)
25	0.591 - 0.623 gms./liter (different samples)	(5)

(1) Monk, 1951

(2) Monk, 1951b

(3) Pearce and Oelke, 1938

(4) Harkins and Pearce, 1916

(5) LaMer and Goldman, 1929; Friedman and LaMer, 1931

The earlier data of Rimbach and Schubert, 1909 are too high.

## SOLUBILITY OF LANTHANUM IODATE IN AQUEOUS SALT SOLUTIONS AT 25°

NOTE: Solubilities in certain solutions (e.g., KCl, K<sub>2</sub>SO<sub>4</sub>) are found in several tables:

24.85	0.73	56.3	3.92	4.24	
23.5	0.52	54.3	2.74	4.10	
NO 22.1	0.35	51.0	1.64	4.08	
21.2	0.29				

\*Saturated with  $\text{La}(\text{NO}_3)_3 \cdot 6\text{H}_2\text{O}$

The distribution coefficient of a mixture of rare earth nitrates, containing 4% lanthanum nitrate, between methyl-n-hexyl ketone and water at room temperature was found to be less than 0.0012, with 33.0% of anhydrous salt in the aqueous phase. (Rothchild, Templeton, and Hall, 1948)

100 cc. of a saturated solution of  $\text{La}(\text{NO}_3)_3 \cdot 6\text{H}_2\text{O}$  in ethyl ether prepared by frequent agitation and allowing to stand overnight at about 20° contain 0.002 gm.  $\text{La}_2\text{O}_3$ . A saturated ethereal solution prepared as above but using Lanthanum nitrate dehydrated at 150° contain only 0.001 gm.  $\text{La}_2\text{O}_3$  per 100 cc. (Wells, 1930)

10 ml. of a saturated solution of lanthanum nitrate in ether at 20° contain 0.1 mg.  $\text{La}_2\text{O}_3$ . (Wells, 1930.) 1 liter of sat. sol. of  $\text{La}(\text{NO}_3)_3 \cdot 6\text{H}_2\text{O}$  in ether contains 1.04 gms.  $\text{La}(\text{NO}_3)_3$  at 17°. (Bachelet, Cheylan and LeBris, 1950.)

Data for the extraction of  $\text{La}(\text{NO}_3)_3$  by ether from aqueous solutions are given by Bock and Bock, 1950.

2.45 gm.  $\text{La}(\text{NO}_3)_3$  dissolve in 100 gm. ethylene diamine at 30°. (Moeller and Zimmermann, 1953.)

100 gm. of a saturated solution of  $\text{La}(\text{NO}_3)_3$  in tri-n-butyl phosphate at 25-27° contains 28.3 gms.  $\text{La}(\text{NO}_3)_3$ . The solid phase is the hexahydrate. (Wendlandt and Bryant, 1956.)

Fusion-point data for mixtures of  $\text{La}(\text{NO}_3)_3 + \text{Mg}(\text{NO}_3)_2$  are given by Quill and Robey, 1937.

## 0 LANTHANUM OXIDE $\text{La}_2\text{O}_3$

### SOLUBILITY OF LANTHANUM OXIDE IN WATER

8.37	4.69	9.66	0.126	10.44	0.005

Deshmukh and Nayak give data for the relative solubility of lanthanum oxide in rochelle salt solutions. The amount of  $\text{La}_2\text{O}_3$  dissolved by boiling the solution for 1 minute were as follows:

(Read from curves drawn by the authors.)

Rochelle salt soln. wt. %	5	10	15	20	25	30
Gms. $\text{La}_2\text{O}_3$ per 100 ml. solution	0.3	.35	.45	.5	1.6	2.2

Data for the separation of  $\text{La}_2\text{O}_3$  from  $\text{Ac}_2\text{O}_3$  and other rare earth oxides by precipitation of the basic acetate are given by Perey, 1949. Graphs are given showing the percentage of La precipitated when  $\text{NH}_3$  is added to  $\text{La}_2\text{O}_3$  solutions in 30 vol. % acetic acid.

Data for the solubility of  $\text{La}(\text{OH})_3$  in fused  $\text{NH}_4\text{NO}_3$  at  $130^\circ$  are given by Vickery, 1949.

LANTHANUM Dimethyl PHOSPHATE  $\text{La}_2[(\text{CH}_3)_2\text{PO}_4]_6 \cdot 4\text{H}_2\text{O}$

PO

100 gms.  $\text{H}_2\text{O}$  dissolve 103.7 gms.  $\text{La}_2[(\text{CH}_3)_2\text{PO}_4]_6$  at  $25^\circ$ .  
(Morgan and James, 1914)

## Li LITHIUM

### LITHIUM Li

#### SOLUBILITY OF LITHIUM IN LIQUID AMMONIA, DETERMINED BY VAPOR PRESSURE MEASUREMENTS (Johnson and Piskur, 1933)

The vapor pressures of solutions of lithium in liquid ammonia at constant temperature give a curve which intersects the horizontal line representing the vapor pressure of the saturated solution. This point was determined at several temperatures with results showing that, contrary to the determinations of Ruff and Geisel, 1906, a slight increase in concentration of lithium in liquid ammonia occurs with increasing temperature.

t°	Vapor Pressure mm. Hg.	Mols. NH <sub>3</sub> per atom Li	Gms. Li per 100 gms. NH <sub>3</sub>
-63.5	1.1	3.81	10.698
-33.2	3.4	3.75	10.866
-32.7	3.4	3.74	10.895
0.0	34.0	3.60	11.319

The eutectic temperature in the system Li - NH<sub>3</sub> is about -185°.

(Birch and MacDonald, 1947)

The reaction  $\text{Li} + \text{NaCl} = \text{LiCl} + \text{Na}$  was studied at 900° by Jelinek, 1920. For data on the system  $\text{Li} + \text{LiH}$  see Messer, et al, 1958.

### AlO LITHIUM ALUMINATE $\text{LiH}(\text{AlO}_2)_2 \cdot 5\text{H}_2\text{O}$

One liter sat. solution of  $\text{LiH}(\text{AlO}_2)_2 \cdot 5\text{H}_2\text{O}$  in Water contains 0.00012 gm. equivalents at 25°, 0.00013 at 50° and 0.00033 at 80° as determined by electrical conductivity. (Prociv, 1929)

### AsO LITHIUM ARSENITE $\text{LiAsO}_2$

#### EQUILIBRIUM IN THE SYSTEM LITHIUM OXIDE, ARSENIC TRIOXIDE AND WATER AT 25°

(Schreinemakers and de Baat, 1920)

Four to six weeks constant agitation was required for saturation.

LITHIUM URAHYL ARSENATE  $\text{Li}(\text{UO}_2)\text{AsO}_4$ 

AsO

The Ksp as determined in dilute  $\text{H}_2\text{SO}_4$  and  $\text{HNO}_3$  solutions at pH 2.05-5.30 is  $[\text{Li}^+][\text{UO}_2^{++}][\text{AsO}_4^{=}] = 1.52 \times 10^{-19}$ .  
(Chukhlantsev and Sharova, 1956)

LITHIUM BOROHYDRIDE  $\text{LiBH}_4$ 

BH

100 gms. ether dissolve 3 gms.  $\text{LiBH}_4$  at  $25^\circ$ .

100 gms. tetrahydrofuran dissolve 28 gms.  $\text{LiBH}_4$  at  $25^\circ$ .  
(Elliott, Roth, Roedel and Boldebuck, 1952)

LITHIUM FLUOBORATE  $\text{LiBF}_4$ 

BF

100 gms. ether dissolve 1.9 gms.  $\text{LiBF}_4$  at  $25^\circ$ .

100 gms. tetrahydrofuran dissolve 71 gms.  $\text{LiBF}_4$  at  $25^\circ$ .  
(Elliott, Roth, Roedel and Boldebuck, 1952)

## LITHIUM BORATE

BO

THE SYSTEM LITHIUM OXIDE - BORIC OXIDE - WATER  
(Dukelski, 1907; Reburn and Gale, 1955; Rollet and Bouaziz, 1955)

The results are in reasonably good agreement. A few of Dukelski's data have been shown to represent supersaturation. The transition temperature for the reaction  $\text{H}_3\text{BO}_3 + \text{Li}_2\text{B}_4\text{O}_7 \cdot 3\text{H}_2\text{O} = \text{Li}_2\text{B}_{10}\text{O}_{16} \cdot 10\text{H}_2\text{O}$  has not been firmly fixed ("between  $10^\circ$  and  $20^\circ$ ;" R. and G.), and there is some question as to the temperature at which the pentaborate ( $\text{Li}_2\text{B}_{10}\text{O}_{16} \cdot 10\text{H}_2\text{O}$ ) becomes congruently soluble. Reburn and Gale found it congruent only above  $40^\circ$ , and Dukelski found it incongruently soluble at  $30^\circ$ . However, Rollet and Bouaziz found congruent solubility in a reinvestigation of the  $30^\circ$  isotherm. All but the  $30^\circ$  data are from Reburn and Gale, 1955, except as noted.

A =  $\text{H}_3\text{BO}_3$       B =  $\text{Li}_2\text{B}_{10}\text{O}_{16} \cdot 10\text{H}_2\text{O}$       C =  $\text{Li}_2\text{B}_4\text{O}_7 \cdot 3\text{H}_2\text{O}$       D =  $\text{LiBO}_2 \cdot 2\text{H}_2\text{O}$   
E =  $\text{LiBO}_2 \cdot 8\text{H}_2\text{O}$       F =  $\text{LiOH} \cdot \text{H}_2\text{O}$       x =  $\text{Li}_2\text{B}_4\text{O}_7 \cdot x\text{H}_2\text{O}$  (Dukelski)

SOLUBILITY OF LITHIUM TETRABORATE ( $\text{Li}_2\text{B}_4\text{O}_7$ ) IN WATER

(Reburn and Gale, 1955; Rollet and Bouaziz, 1955)

The trihydrate  $\text{Li}_2\text{B}_4\text{O}_7 \cdot 3\text{H}_2\text{O}$  is apparently the stable phase. It is conveniently prepared by boiling solutions containing equivalent proportions of the oxides. Rollet and Bouaziz report that a study of the system  $\text{Li}_2\text{B}_4\text{O}_7 - \text{LiCl} - \text{H}_2\text{O}$  at 30° showed the solid to be the tetrahydrate, but no supporting data are given. Gode, 1949a prepared and identified the trihydrate crystals. Rollet and Bouaziz data are given in parentheses. The earlier data of Dukelski on a "colloidal" tetraborate were obtained in supersaturated (non-equilibrium) solutions.

## BO LITHIUM PERBORATE $\text{Li}_2\text{B}_2\text{O}_5 \cdot 2-1/2\text{H}_2\text{O}$

100 cc. water dissolve 10-13 gm. lithium perborate at ordinary temperature. (Bezner-Lowy, 1923)

Melting point data are given for:

$\text{LiBO}_2 + \text{LiF}$	(Kitaigorodski, Popova and Botwinkin, 1933)
$\text{LiBO}_2 + \text{Li}_2\text{SiO}_3$	(Klooster, 1910-11)
$\text{LiBO}_2 + \text{NaBO}_2$	(Klooster, 1910-11)
$\text{LiBO}_2 + \text{Li}_2\text{SO}_4$	(Kislova, Posypaiko and Bergman, 1955)
$\text{LiBO}_2 + \text{Li}_2\text{WO}_4$	(Kislova, Posypaiko and Bergman, 1955, 1955a)

Limited data for cryoscopy in fused  $\text{LiBO}_2$ :

With $\text{NaCl}$ , $\text{LiCl}$ , $\text{BaCl}_2$ , $\text{Na}_4\text{P}_2\text{O}_7$	(Zarzycki, 1952, 1953)
With $\text{NaCl}$ , $\text{LiCl}$ , $\text{BaCl}_2$ , $\text{TiO}_2$ , $\text{NiO}$	(Darmois and Zarzycki, 1951)
With many fluorides	(Zarzycki, 1953a)

## Br LITHIUM BROMIDE $\text{LiBr}$

### SOLUBILITY IN WATER

Earlier investigators failed to find the pentahydrate. Heiks and Garrett studied the system only below  $+5^\circ$ , and the bulk of their data are given only as graphs. It is not clear why the agreement on solutions saturated with dihydrate ( $5-35^\circ$ ) is so poor.

# Li LITHIUM

## SOLUBILITY OF LITHIUM BROMIDE IN ABSOLUTE ETHYL ALCOHOL (Bonnell and Jones, 1926)

The results in parentheses were obtained by thermal analysis. The eutectic point for LiBr + LiBr·4C<sub>2</sub>H<sub>5</sub>OH is at 13.2°. The congruent m. pt. of LiBr·4C<sub>2</sub>H<sub>5</sub>OH is 23.8°.

Between 13.2° and 23.8° lithium bromide alcoholate is formed and different values are obtained depending upon the solid phase present.

## THE SYSTEM LITHIUM AMMONIUM d-TARTRATE, LITHIUM AMMONIUM l-TARTRATE AND WATER (Campbell and Slotin, 1933)

The saturated solutions and the solid phases were analyzed polarimetrically using as a scale the rotations of solutions of pure Lithium Ammonium d Tartrate of different concentrations, determined for the sodium D line at 30°. The isotherm at 0° was determined and the invariant points only at 30° and 60°.

# Li LITHIUM

## LITHIUM LAURATE, MYRISTATE, PALMITATE, STEARATE and OLEATE

SOLUBILITY OF EACH OF THESE SALTS, DETERMINED SEPARATELY, IN SEVERAL SOLVENTS

(Jacobson and Holmes, 1916; Partheil and Ferie, 1903 in parentheses)

Li laurate =  $C_{11}H_{23}COOLi$ , Li myristate =  $C_{13}H_{27}COOLi$ , Li palmitate =  $C_{15}H_{31}COOLi$ , Li stearate =  $C_{17}H_{35}COOLi$  and Li oleate =  $C_{17}H_{33}COOLi$

The lithium salts were prepared by adding the calculated amount of lithium acetate to the alcoholic solutions of the respective fatty acids. The resulting precipitates were dissolved in boiling alcohol and the solutions allowed to stand overnight in a cool place. The salts so obtained were washed and dried. Excess of salt shaken with solvent for 2 hrs. in all cases. The sat. sol. was analyzed by evaporating to dryness and weighing residue.

The phase diagram of the system lithium palmitate - water was determined by Vold, 1943, and it resembles that of sodium palmitate. The effect of adding small amounts of lithium chloride to the solutions is discussed. Only the compositions of the invariant solutions are given in tabular form.

Phase diagrams for the systems lithium stearate - decalin and lithium stearate - cetane are reported by Vold and Vold, 1950.

## CO LITHIUM CARBONATE Li<sub>2</sub>CO<sub>3</sub>

### SOLUBILITY IN WATER (Bevade, 1885; Fluckiger, 1887; Draper, 1887)

An average curve was constructed from the available results and the following table read from it.

More recent results at 0° agreeing with the above are given by Rosenheim and Reglin, 1921; and at 0° and 100°, by Kraus and Burgess, 1927; and at 25° by Ageno and Valla, 1911; also Weber, 1929.

t°	Gms. Li <sub>2</sub> CO <sub>3</sub> per 100 Gms.		t°	Gms. Li <sub>2</sub> CO <sub>3</sub> per 100 Gms.	
	Water	Solution		Water	Solution
0	1.54	1.52	40	1.17	1.16

30	1.25	1.24	100	0.72	0.71

Density of saturated solution at 0° = 1.017; at 15° = 1.014.

Determinations of the equilibrium in aqueous solutions of lithium carbonate and bicarbonate in relation to the partial pressure of the carbon dioxide in the gas phase in contact with the solution are given by Walker, Bray and Johnston, 1927.

### SOLUBILITY OF LITHIUM CARBONATE IN WATER UNDER HIGH PRESSURES OF CARBON DIOXIDE (Haehnel, 1937)

A platinum lined autoclave was used and the mixtures shaken 1 hour and allowed to stand 1/2 hour before removing a sample for analysis. Lithium carbonate goes into solution in water in presence of CO<sub>2</sub> as bicarbonate. Such aqueous bicarbonate solutions are stable above -12° only under a CO<sub>2</sub> pressure of more than 1 atmosphere. The results are presented both in terms of gms. of Li<sub>2</sub>CO<sub>3</sub> (shown in parentheses in the following table) and of LiHCO<sub>3</sub> per 100 gms. sat. solution.

## Cl LITHIUM CHLORIDE LiCl

### SOLUBILITY OF LITHIUM CHLORIDE IN WATER

The results of Huttig and Rensher, 1924; Benrath, 1927, 1932a; Deacon, 1927; Friend and Culley, 1931; Bassett and Sanderson, 1932; Appleby and Crawford, 1934; and Friend, Hale and Ryder, 1937 were plotted and from the average curve, the values above 0° were taken. The data below 0° are those of Woskressenskaya and Janatieva, 1937. The system has also been studied by Moran, Jr., 1956 and Garrett and Woodruff, 1951 at low temperatures. For other freezing points of dilute solutions see Klein and Svanberg, 1920 and Rodebush, 1918.

## C1 THE SYSTEM LITHIUM CHLORIDE - MAGNESIUM CHLORIDE - WATER (Woskresenskaja and Janatjeva, 1937)

The eutectic temperature is -78°, with the solution containing 23.6% LiCl, 3.6% MgCl<sub>2</sub>, and the saturating phases Ice + LiCl·5H<sub>2</sub>O + Double Salt (composition not determined). The results are also expressed in molar bases.

## DISTRIBUTION OF LITHIUM CHLORIDE BETWEEN WATER AND AMYL ALCOHOL

Results at 24.9°  
(Cavanagh, 1924)

The mixtures were shaken in sealed tubes of about 600 cc. capacity. One of these was charged 10 times, precisely similarly, and provided a total of 2.5 liters of the amyl alcohol layer. These 10 successive samples of non aqueous equilibrium phase were shaken in turn with one and the same small aqueous phase (100 cc.) in a second tube, and this latter analyzed for Cl by a silver titration method. The procedure consisted essentially in the piece-meal concentration of a large amount of the phase to be analyzed, and the concentration of the LiCl dissolved therein by a piece-meal extraction of it with water.

Approx. Normality of LiCl in aq. Phase	Gm. mols. LiCl per 1000 gms.		Partition coefficient

## Li LITHIUM

### Fusion-point data--Cont.

$\text{LiCl} + \text{Li}_2\text{SO}_4 + \text{Li}_2\text{WO}_4$	(Bergman, Kislova and Posypaiko, 1954)
$\text{LiCl} + \text{NaCl} + \text{CaCl}_2$	(Plyushchev, Komissarova, Meshchanina, and Akulkina, 1956)
$\text{LiCl} + \text{ZnCl}_2$	(Evseeva and Bergman, 1951)
$2\text{LiCl} + \text{ZnSO}_4 \rightleftharpoons \text{Li}_2\text{SO}_4 + \text{ZnCl}_2$	(Evseeva and Bergman, 1951)
$\text{LiCl} + \text{RbF} \rightleftharpoons \text{LiF} + \text{RbCl}$	(Volkov and Tumash, 1953)
$2\text{LiCl} + \text{SrF}_2 \rightleftharpoons 2\text{LiF} + \text{SrCl}_2$	(Banashchik and Bergman, 1954)
$2\text{LiCl} + \text{Na}_2\text{SO}_4 \rightleftharpoons \text{Li}_2\text{SO}_4 + 2\text{NaCl}$	(Bergman and Akopov, 1953)
$\text{LiCl} + \text{LiNO}_3$	(Blidin, 1940; Sumarokova, 1957)
$\text{LiCl} + \text{NaNO}_3 \rightleftharpoons \text{LiNO}_3 + \text{NaCl}$	(Blidin, 1940)
$\text{LiCl} + \text{LiVO}_3$	(Schmitz-Dumont and Schmitz, 1944)
$\text{LiCl} + \text{AgCl}$	(Lesnykh and Bergman, 1953b)
$2\text{LiCl} + \text{Ag}_2\text{SO}_4 \rightleftharpoons \text{Li}_2\text{SO}_4 + 2\text{AgCl}$	(Lesnykh and Bergman, 1953b)
$6\text{LiCl} + \text{Pb}_3(\text{VO}_4)_2 \rightleftharpoons 2\text{Li}_3\text{VO}_4 + 3\text{PbCl}_2$	(Bukhalova and Aleshkina, 1953)

For a study of reactions of  $\text{LiCl}$  + other alkali halides below the melting points, see Link and Wood, 1940.

## . ClO LITHIUM CHLORATE $\text{LiClO}_3$

### SOLUBILITY OF LITHIUM CHLORATE IN WATER

(Kraus and Burgess, 1927; Berg, 1929; Campbell and Griffiths, 1956)

The results are in generally good agreement. The nature of the stable saturating phase between 20 and 40° has been disputed. Campbell and Griffiths report it to be  $\text{LiClO}_3 \cdot 1/4 \text{H}_2\text{O}$ , Berg  $\text{LiClO}_3 \cdot 1/3 \text{H}_2\text{O}$ , while Kraus and Burgess thought it to be merely an anhydrous  $\text{LiClO}_3$ . The data below are those of Kraus and Burgess which were made by observing the temperature at which the last crystal of solid phase disappeared in the melt. Careful control of the temperature and vigorous stirring were necessary. The mixtures were kept under a slight excess pressure of dry nitrogen. The temperatures were read by means of a copper-constantan thermocouple.

THE SYSTEM LITHIUM IODIDE - LEAD IODIDE - WATER  
(Demassieux and Roger, 1937; Roger, 1944)

The authors studied the system at 0°, 25°, 50°, and 60°, but present tables of data only for 25°. The 0° isotherm is discussed and a diagram drawn, but at 50° and 60° it is simply stated that "The curves have the same form as at 0° and 25°." The refractive indices were also determined.

### LITHIUM NITRATE LiNO<sub>3</sub>

NO

#### SOLUBILITY IN WATER

(Donnan and Burt, 1903; Campbell and Bailey, 1958; Campbell, 1942; Massink, 1918; Malquori, 1928d)

The values were read from an average curve. Between 0-30° the data are scattered but in general agreement; above 30° (to 64°) Donnan and Burt report a stable hemihydrate LiNO<sub>3</sub>· $1\frac{1}{2}$ H<sub>2</sub>O; Campbell and Bailey found only the anhydrous salt above 30°. There is also disagreement on the eutectic composition.

## THE SYSTEM LITHIUM NITRATE - LITHIUM SULFATE - WATER

Massink (1918) reports two complex double salts at 35°. These data are questioned by Aravamudan (1957) on several grounds, and this author found the system to be simple. In addition, no evidence for the presence of anhydrous  $\text{Li}_2\text{SO}_4$  was obtained at 30 or 35°.

Additional data at 0°, 30° and 70° are given by Massink, 1916.

$\text{N} = \text{LiNO}_3$ ;  $\text{N} \cdot 3 = \text{LiNO}_3 \cdot 3\text{H}_2\text{O}$ ;  $\text{N}\frac{1}{2} = \text{LiNO}_3 \cdot \frac{1}{2}\text{H}_2\text{O}$ ;  $\text{S} = \text{Li}_2\text{SO}_4$ ;  $\text{S} \cdot 1 = \text{Li}_2\text{SO}_4 \cdot \text{H}_2\text{O}$ ;  $\text{A} = 11:1:17 = 11\text{Li}_2\text{SO}_4 \cdot \text{LiNO}_3 \cdot 17\text{H}_2\text{O}$ ;  $\text{B} = 9:1:27 = 9\text{Li}_2\text{SO}_4 \cdot \text{LiNO}_3 \cdot 27\text{H}_2\text{O}$

THE SYSTEM LITHIUM NITRATE - TERTIARY BUTYL ALCOHOL - WATER AT 25°  
(Ginnings, Herring and Webb, 1933)

The composition of the homogeneous mixture (plait point) of the three compounds as determined by the synthetic method is 16.0 gms. LiNO<sub>3</sub> + 23.0 gms. tertiary Butyl Alcohol, (CH<sub>3</sub>)<sub>3</sub>COH, per 100 gms. sat. solution. The original results for the remaining points on the binodal curve are not given but only the values corresponding to derived empirical equations for the curve.

Results for the extraction of saturated LiNO<sub>3</sub> solutions by ether in the presence of 1M HNO<sub>3</sub> are given by Bock and Bock, 1950.

THE SYSTEM LITHIUM NITRATE - DIOXANE - WATER  
(Klochko and Grigor'ev, 1952)

The concentrations of LiNO<sub>3</sub> which cause layer separation of 1:1 (equimolar) dioxane - water mixtures were determined. Solutions containing <3.39 mole % LiNO<sub>3</sub> show no separation from 0-145°. Those >28.44 mole % LiNO<sub>3</sub> show none from 0-80°. The "layer-separation" zone is an inverted triangle with its apex at 8.8°, 11.4 mole % LiNO<sub>3</sub>.

At 15° the area extends from 11-13 mole % LiNO<sub>3</sub>.

## PO LITHIUM HYPOPHOSPHATE Li<sub>4</sub>P<sub>2</sub>O<sub>6</sub>·7H<sub>2</sub>O

100 gms. H<sub>2</sub>O dissolve 0.83 gm. hypophosphate at ord. temp.

(Rammelsberg, 1892)

## LITHIUM Sub PHOSPHATE Li<sub>2</sub>PO<sub>3</sub>·3-1/2H<sub>2</sub>O

100 gms. sat. solution of lithium subphosphate in water contain 0.1018 gm. Li<sub>2</sub>PO<sub>3</sub> at 0°, 0.0575 gm. at 25° and 0.048 gm. at 40°. These determinations are only approximately correct since it was impossible to obtain the saturated solution in a clear condition either by long standing or by filtration. A determination made by electrolytic conductivity gave 0.1267 gm. Li<sub>2</sub>PO<sub>3</sub> per liter sat. sol. in water at 25°.

(Rosenheim and Reglin, 1921)

## SO LITHIUM SULFATE $\text{Li}_2\text{SO}_4$

### SOLUBILITY OF LITHIUM SULFATE IN WATER (Friend, 1929; Campbell, 1943)

Friend reported a dihydrate at about  $-10^\circ$  which Campbell could not find. The data below are those of Friend except for solutions saturated with ICE, and above  $100^\circ$ . Campbell also gives vapor pressure data from  $60$ - $227^\circ$ . For cryoscopic data on very dilute solutions, see Indelli, 1953. The figures in parentheses are densities.

## THE SYSTEM LITHIUM SULFATE - AMMONIUM SULFATE - WATER

(Schreinemakers, Cocheret, Filippo and de Waal, 1905, 1907 (30, 50°);  
Campbell, McCulloch and Kartzmark, 1954 (0°, 72°, 95°); Skarulis,  
Horan, Maleeny, Felten, (0°, 25°))

Limited solid solutions of (NH<sub>4</sub>)<sub>2</sub>SO<sub>4</sub> in Li<sub>2</sub>SO<sub>4</sub>·H<sub>2</sub>O are formed.  
These were found by Campbell at 95°, and by careful work by Skarulis,  
at 0° and 25°. Additional data for the triple points of this system at  
20°, 57° and 97° are given by Spielrein (1913), but the terms in which  
the results are presented are not clearly shown.

LUTETIUM SULFATE  $\text{Lu}_2(\text{SO}_4)_3 \cdot 8\text{H}_2\text{O}$   
(CASSIOPEIUM SULFATE)

SO

100 gms. sat. solution of lutetium sulfate in water contain 32.10 gm.  $\text{Lu}_2(\text{SO}_4)_3$  at  $20^\circ$  and 14.48 gms. at  $40^\circ$ . (Jackson and Rienacker, 1930)

## Mg MAGNESIUM

### MAGNESIUM Mg

#### THE SOLUBILITY OF MAGNESIUM AND OF MAGNESIUM ALLOYS IN AQUEOUS SALT SOLUTIONS AND SEA WATER (Whitby, 1932, 1933)

A method based upon the oxygen absorbed and hydrogen evolution was developed. No absorption of oxygen could be detected but the evolution of hydrogen could be accurately measured in samples of gas periodically removed from above the corroding liquid. Large variations in rate of dissolution of different grades of Mg, containing varying traces of impurities in 0.1 n to 3.0 n NaCl and 0.05 nHCl, was encountered. The presence of 0.02 percent Mn causes an acceleration of attack with time. The rate of attack in sea water was lower, due to the presence of sulfates. Traces of saponin increase the rate of H evolution. Three magnesium-base alloys and one type of duraluminum gave substantially the same results as pure Mg. Non metallic impurities such as inclusions of nitride or oxide do not act either as cathodes or nuclei for anodic attack in NaCl solutions. The initial rate of dissolution of Mg in H<sub>2</sub>O, conc. and dilute solutions of KCl, KBr, KI and K<sub>2</sub>SO<sub>4</sub> and in aqueous solutions of alkali is always practically the same. A theory of "primary preferential hydroxyl ion discharge" is proposed and supported by free energy calculations.

100 gms. sat. solution of magnesium in mercury contain 0.323 gm. Mg at 25°. (Loomis, 1922)

Fusion-points of mixtures of Mg + Hg are given by Cambi and Speroni, 1915.

Data are given for the systems:

Mg + MgCl<sub>2</sub> at 860°, 1000° (Ostertag, 1955)

Mg + PbCl<sub>2</sub> = MgCl<sub>2</sub> + Pb (Ruff & Busch, 1925; Palkin & Redchenko, 1956)

### AlO MAGNESIUM ALUMINATE

Data for the system MgO - Al<sub>2</sub>O<sub>3</sub> - SiO<sub>2</sub> - H<sub>2</sub>O from 430-990° are given by Yoder, 1952.

### AsO MAGNESIUM ARSENITES

Some results in the system magnesium oxide, arsenic trioxide and water at 25° are given by Story and Anderson, 1924.

MAGNESIUM ARSENATES  $Mg_3(AsO_4)_2$ ,  $MgHASO_4$ 

AsO

## Br MAGNESIUM BROMIDE ETHERATES, ALCOHOLATES, ACIDATES, ETC.

### SOLUBILITIES RESPECTIVELY IN ETHER, ALCOHOL, ACIDS, ETC., AT VARIOUS TEMPERATURES (Boris N. Menachutkin, 1907)

(Monograph in the Russian language entitled "On Etherates and Other Molecular Combinations of Magnesium Bromide and Iodide." St. Petersburg, 1907, pp. 267 and XLVIII. Also published in the Memoirs of the St. Petersburg Polytechnic Institute, Vols. 1-7, 1904-1907, and in condensed form in Vols. 49-62 of the Zeit. anorg. Chem., 1906-1909.)

Preparation of Material. The dietherate of magnesium bromide, MgBr<sub>2</sub>·2(C<sub>2</sub>H<sub>5</sub>)<sub>2</sub>O (Z. anorg. Chem., 49, 34, '06) was prepared by the very gradual addition of bromine to a cold mixture of magnesium powder and dry ether. It is very hygroscopic and is stable only under its ethereal solution. It is decomposed by water and reacts with very many organic compounds as alcohols, acids, ketones, esters, aldehydes, etc. The addition products thus formed constitute the material employed in the author's succeeding studies. The monoetherate of magnesium bromide, MgBr<sub>2</sub>·(C<sub>2</sub>H<sub>5</sub>)<sub>2</sub>O, was prepared just as the dietherate, but the temperature during crystallization was kept above 30°, at which point the dietherate is converted to monoetherate. It is also precipitated by dry ligroin.

Method of Determination of Solubility. At temperatures below 30° the determinations were made by agitating an excess of the salt with the solvent and analyzing the saturated solution. At the higher temperatures the synthetic (sealed tube) method of Alexejeff (Wied. Ann., 1885) was used. See also Magnesium Iodide Etherates.

## MAGNESIUM BROMIDE ETHERATES

SOLUBILITY OF MAGNESIUM BROMIDE DIETHERATE,  $MgBr_2 \cdot 2(C_2H_5)_2O$ , AND OF MAGNESIUM BROMIDE ETHERATE,  $MgBr_2(C_2H_5)_2O$ , IN ETHYL ETHER,  $(C_2H_5)_2O$ , AT VARIOUS TEMPERATURES  
(Menschutkin, see preceding page.)

Solubility of the Dietherate in Ether

## Br MAGNESIUM BROMIDE ALCONOLATES

SOLUBILITY OF ETHYL, METHYL, PROPYL, ETC., ALCOHOLATES OF MAGNESIUM BROMIDE IN THE RESPECTIVE ALCOHOLS (Menschutkin, 1907)

These compounds were all prepared by the action of magnesium bromide dietherate upon the several alcohols. The ether was expelled and the new alcoholate addition product recrystallized from the respective alcohol. The solubility determinations were made by the synthetic method.

Solubility of $\text{MgBr}_2 \cdot 6\text{CH}_3\text{OH}$ in Methyl Alcohol		Solubility of $\text{MgBr}_2 \cdot 6\text{C}_2\text{H}_5\text{OH}$ in Ethyl Alcohol		Solubility of $\text{MgBr}_2 \cdot 6\text{C}_3\text{H}_7\text{OH}$ in Propyl Alcohol		Solubility of $\text{MgBr}_2 \cdot 6\text{C}_4\text{H}_9\text{OH}$ in IsoButyl Alcohol

**MAGNESIUM BROMIDE compounds with METHYLAL, ORTHO ETHYLFORMATE,  
FORMIC ACID and ACETIC ACID**

SOLUBILITY RESPECTIVELY IN METHYLAL, ORTHO ETHYLFORMATE,  
FORMIC ACID AND ACETIC ACID  
(Menschutkin, 1907a)

The compounds were prepared by the action of methylal, ortho ethylformate and absolutely dry formic and acetic acids on magnesium dietherate. In the case of the latter compounds the results are only approximately correct, due to their extreme hygroscopicity.

Saturation was obtained by continuous rotation for 7 to 10 hours.

MAGNESIUM LACTATE  $\text{Mg}(\text{C}_3\text{H}_5\text{O}_2)_2 \cdot 3\text{H}_2\text{O}$ 

100 gms. Methyl Alcohol sat. with anhydrous magnesium lactate dissolve 2.27 gms.  $\text{Mg}(\text{C}_3\text{H}_5\text{O}_2)_2$  at  $15^\circ$  and 1.14 gms. at  $66.1^\circ$  (b. pt.).

(Henstock, 1934)

## 1.5 MAGNESIUM

CH MAGNESIUM diLACTATE  $\text{Mg}(\text{C}_6\text{H}_8\text{O}_5)_2 \cdot 6\text{H}_2\text{O}$  racemic,  $\text{Mg}(\text{C}_6\text{H}_8\text{O}_5)_2 \cdot 3\text{H}_2\text{O}$ , Inactive

### SOLUBILITY OF RACEMIC AND OF INACTIVE MAGNESIUM diLACTATE IN WATER (Jungfleisch, 1912)

100 gms.  $\text{H}_2\text{O}$  dissolve 7 to 8 gms. racemic and 2.28 gms. inactive lactate at  $15^\circ$ .

MAGNESIUM GLUCONATE  $\text{Mg}(\text{C}_6\text{H}_{11}\text{O}_7)_2 \cdot 3\text{H}_2\text{O}$

100 gms. sat. solution of  $\text{Mg}(\text{C}_6\text{H}_{11}\text{O}_7)_2 \cdot 3\text{H}_2\text{O}$  in Water contain 7.8 gms.  $\text{Mg}(\text{C}_6\text{H}_{11}\text{O}_7)_2$  at  $25^\circ$ . (May, Weisberg and Herrick, 1929)

MAGNESIUM DIPHENYL  $\text{Mg}(\text{C}_6\text{H}_5)_2$

### Results of Strohmeier, 1955

Solvent	Solubility at $20^\circ$
Heptane	0.0001 gms. $\text{Mg}(\text{C}_6\text{H}_5)_2$ per liter
Benzene	0.11 "
Dioxane	42.9 "
Ethyl ether	$\infty$ "

MAGNESIUM BENZOATE  $\text{Mg}(\text{C}_6\text{H}_5\text{COO})_2 \cdot 4 \text{H}_2\text{O}$

100 gms.  $\text{H}_2\text{O}$  dissolve 6.16 gms.  $\text{Mg}(\text{C}_6\text{H}_5\text{COO})_2$  at  $15^\circ$  and 19.6 gms. at  $100^\circ$ .  
(Tarugi and Checchi, 1901)

100 cc. sat. solution of Magnesium benzoate in water contain 6.364 gms.  $\text{Mg}(\text{C}_6\text{H}_5\text{COO})_2$  at  $20^\circ$ .  
(Ephraim and Pfister, 1925)

100 gms.  $\text{H}_2\text{O}$  dissolve 3.33 gms.  $\text{Mg}(\text{C}_6\text{H}_5\text{COO})_2$  at  $15-20^\circ$ .  
(Squire and Caines, 1905)

100 gms. Acetone sat. with anhydrous  $\text{Mg}$  benzoate dissolve 2.38 gm.  $\text{Mg}(\text{C}_6\text{H}_5\text{COO})_2$  at  $15^\circ$ .  
(Henctock, 1934)

MAGNESIUM 4-Nitro BENZOATE  $\text{Mg}(\text{C}_6\text{H}_4\cdot\text{NO}_2\cdot\text{COO})_2 \cdot 6\text{H}_2\text{O}$

100 cc. sat. solution of Magnesium 4-Nitro benzoate in water contain 1.840 gms.  $\text{Mg}(\text{C}_6\text{H}_4\text{NO}_2\text{COO})_2$  at  $20^\circ$ .  
(Ephraim and Pfister, 1925)

MAGNESIUM BENZOATE Tri Methyl Alcoholate  $\text{Mg}(\text{C}_6\text{H}_5\text{COO})_2 \cdot 3\text{CH}_2\text{OH}$ 

CH

100 gms. Methyl Alcohol sat. with the tri alcoholate dissolve 1.24 gms.  $\text{Mg}(\text{C}_6\text{H}_5\text{COO})_2$  at 15° and 70.98 gms. at 71.9° (b. pt.).  
(Henstock, 1934)

MAGNESIUM SALICYLATE  $\text{Mg}(\text{C}_7\text{H}_5\text{O}_3)_2 \cdot 4\text{H}_2\text{O}$ 

100 gms. sat. solution in water contain 20.4 gms. salicylate at 15° (14.3 gms. Squire and Gaines, 1905), and 79.7 gms. at 100°.  
(Tarugi and Checchi, 1901)

100 gms. 90% alcohol dissolve 0.6 gm. salicylate at 15°-20°.  
(Squire and Gaines, 1905)

MAGNESIUM PHTHALATE  $\text{MgC}_6\text{H}_4(\text{COO})_2$

Man  $= (\text{C}_6\text{H}_5\text{CH}(\text{OH})\text{COO})_2$

(l) = Determined polarimetrically

Other values for the solubility of the (r) and (l) salts in water are as follows:

Gms. $\text{Mg}(\text{C}_8\text{H}_7\text{O}_3)_2$ per 100 gms. sat. sol.			Authority
t°	(r) Salt	(l) Salt	
16	--	4.5	McKenzie, 1899
18	1.8	--	" "
25	2.61	--	Ross and Morrison, 1936
25	--	6.08	" " " and Johnstone, 1937

Ross and Morrison, 1936 also give results for the system Magnesium (r) Mandelate + (r) Mandelic Acid +  $\text{H}_2\text{O}$  at 25° in which the acid salt,  $2\text{Mg}(\text{C}_8\text{H}_7\text{O}_3)_2 \cdot \text{C}_8\text{H}_7\text{O}_3 \cdot 2\text{H}_2\text{O}$  is formed.

Ross, Morrison and Johnstone, 1937, give results for the system Magnesium (l) Mandelate + (l) Mandelic Acid +  $\text{H}_2\text{O}$  at 25° in which the acid salt which is formed probably has the same composition as that of the (r) compound but, due to analytical difficulties, metastability and slowness with which equilibrium is attained, conclusive results were not obtained.

MAGNESIUM CINNAMATE  $Mg(C_6H_5CH=CHCOO)_2 \cdot 1$  or  $\frac{1}{2} H_2O(?)$

## Mg MAGNESIUM

### CH MAGNESIUM OLEATE $(\text{CH}_3(\text{CH}_2)_{13}\text{CH}=\text{CH}\cdot\text{CH}_2\text{COO})_2\text{Mg}$

One liter  $\text{H}_2\text{O}$  dissolves about 0.23 gm. oleate (soap).

(Fahrion, 1916)

100 gms. glycerol ( $d$  1.114) dissolve 0.94 gm. oleate.

(Asselin, 1873)

### MAGNESIUM OLEATE $(\text{C}_{17}\text{H}_{33}\text{COO})_2\text{Mg}$

Solutions prepared by rubbing magnesium oleate (prepared from technical sodium oleate) with water or salt solution and allowing to stand at room temperature for 36 hours, contained from 4.28 to 5.42 milligrams Mg per liter of water and 5.85 to 5.77 milligrams Mg per liter of 0.05 or 0.1 percent aqueous NaCl solution.

(Zink and Liere, 1915)

Solutions prepared by heating a suspension of magnesium oleate in water or aqueous salt solution to the boiling point and allowing to cool, contained 50.6 parts Mg per liter of water, 99.89 parts Mg per liter of 0.1 percent aq. NaCl and 90.26 parts Mg per liter of 0.1 percent aq. KCl solution.

(Haupt, 1914)

100 gms. 63.07 wt. % aq. alcohol dissolve 4.60 gms.  $(\text{C}_{17}\text{H}_{33}\text{COO})_2\text{Mg}$  at 25°

" 72.17

6.64

" 86.16

8.60

(Thomas and Yu, 1923)

### CH MAGNESIUM PALMITATE $(\text{C}_{16}\text{H}_{31}\text{COO})_2\text{Mg}$

(Also see below)

Solutions prepared by rubbing magnesium palmitate (prepared from pure sodium palmitate) with water or aqueous salt solution and allowing to stand at room temperature for 36 hours contained from 2.82 to 3.03 milligrams Mg per liter of water and 3.12 to 3.03 milligrams Mg per liter of 0.05 to 0.10 percent aqueous NaCl solution.

(Zink and Liere, 1915)

Solutions prepared by heating a suspension of magnesium palmitate in water or aqueous salt solution to the boiling point and allowing to cool, contained 55.68 parts Mg per liter of water 92.21 parts Mg per liter of 0.1 percent aq. NaCl and 72.39 parts Mg per liter of 0.1 percent aq. KCl.

(Haupt, 1914)

### MAGNESIUM STEARATE $(\text{C}_{17}\text{H}_{35}\text{COO})_2\text{Mg}$

(Also see below)

Solutions prepared by rubbing magnesium stearate (prepared from commercial sodium stearate) with water or salt solutions and allowed to stand at room temperature for 36 hours contained from 3.17 to 3.23 milligrams Mg per liter of water and 3.70 to 3.84 milligrams Mg per liter of 0.05 to 0.1% aq. NaCl solution.

(Zink and Liere, 1915)

Solutions prepared by heating a suspension of magnesium stearate in water or aqueous salt solution to the boiling point and allowing to cool, contained 65.89 parts Mg per liter of  $\text{H}_2\text{O}$ , 95.79 parts Mg per liter of 0.1% aq. NaCl solution and 99.62 parts Mg per liter of 0.1% aq. KCl solution.

(Haupt, 1914)

SOLUBILITY OF MAGNESIUM STEARATE IN AQUEOUS SOLUTIONS OF  
ETHYL ALCOHOL AT 25°

SOLUBILITY IN "CO<sub>2</sub>-FREE" WATER

At 15°

Extrapolation of the data of Treadwell and Reuter, 1898 shows that at 0 partial pressure of CO<sub>2</sub> and at 15° and mean barometric pressure, one liter of saturated aqueous solution contains 0.641 gm. of MgCO<sub>3</sub> plus 1.954 gms. Mg(HCO<sub>3</sub>)<sub>2</sub>.

At 100°

(Leick, 1932, 1933)

The determinations showed that 0.030 gm. MgO = 0.063 gm. MgCO<sub>3</sub> per liter was dissolved at 100°. It was found that the solubility is increased by NaCl and Na<sub>2</sub>SO<sub>4</sub>. NaOH and Na<sub>2</sub>CO<sub>3</sub> do not reduce the solubility of MgCO<sub>3</sub> as much as they do that of CaCO<sub>3</sub>. Results for the simultaneous solubility of MgCO<sub>3</sub> and CaCO<sub>3</sub> in water at 100° show that with increasing time of boiling, from 1-1/2 to 48 hours, the dissolved CaO increased about 5 times while the dissolved MgO decreases about 10 times. The results are of interest in connection with the purification of boiler waters.

RESULTS IN WATER WITH UP TO 1 ATM. PARTIAL PRESSURE OF CO<sub>2</sub>

At 15°

Considerable data are given by Treadwell and Reuter, 1898, giving total Mg<sup>++</sup>, HCO<sub>3</sub><sup>-</sup>, and CO<sub>3</sub><sup>=</sup>, but it is pointed out by Johnston (1915) that although Treadwell and Reuter made very painstaking analyses, their mode of working did not secure equilibrium conditions, a fact which is borne out by the lack of constancy of the calculated solubility-product constant.

At 18°  
(Johnston, 1915)

It is shown that if the CO<sub>2</sub> pressure is kept constant at P and the water evaporated off so slowly at 18° that equilibrium conditions are continuously maintained, the following amounts of Mg(OH)<sub>2</sub> or of MgCO<sub>3</sub>·3H<sub>2</sub>O will be obtained.

Partial Pressure P of CO <sub>2</sub> in Atms.	Total Mg Mols./l	Gms. per Liter	
0	0.00015	0.0087	Mg(OH) <sub>2</sub>

Results are also given for the solubility of  $5\text{MgO} \cdot 4\text{CO}_2 \cdot 7\text{H}_2\text{O}$  in Water saturated with  $\text{CO}_2$  at one atmosphere pressure.

Determinations of the equilibrium in the system  $\text{MgCO}_3 + \text{CO}_2 + \text{H}_2\text{O}$  made by passing  $\text{CO}_2$  at atmospheric pressure through mixtures of  $\text{H}_2\text{O} + \text{MgO}$  and  $\text{H}_2\text{O} + \text{MgCO}_3$  at temperatures from 0° to 40°, are given by Tereda, 1928. There is, however, some uncertainty in regard to the exact terms in which the results are expressed.

Data for the system magnesium carbonate-carbonic acid-water at 20°, 25°, 30°, 34° and 39° are given by Leather and Sen (1914). In connection with these results, it is pointed out by Johnston (1915), that it is questionable whether equilibrium was really obtained and furthermore, the accuracy of the analytical results cannot be trusted since the ratio of total amount of  $\text{CO}_2$  in solution, to the magnesia is very irregular. The results when plotted directly show great inconsistencies.

SOLUBILITY IN WATER SATURATED WITH CO<sub>2</sub> AT ONE ATMOSPHERE

# Mg MAGNESIUM

(Results of Haehnel, 1924)

The saturated solutions were prepared in a platinum vessel provided with an electrically driven stirrer and contained in an autoclave. After stirring one hour and allowing to stand one-half hour the saturated solution was withdrawn through a platinum tube and analyzed by evaporating and weighing the ignited MgO. Equilibrium was approached from above. Magnesium carbonate from different sources was used.

# Mg MAGNESIUM

## SOLUBILITY OF MAGNESIUM CARBONATE IN AQUEOUS SOLUTIONS OF POTASSIUM BICARBONATE (Auerbach, 1904)

The conditions necessary for preventing changes in equilibrium due to hydrolysis and loss of  $\text{CO}_2$  are discussed. The mixtures were shaken from 1-4 days. The sat. sol. analyzed for total alkali ( $\text{K} + \text{Mg}/2$ ) by titration with standard  $\text{HCl}$  using methyl orange as indicator. The neutralized solution was boiled to expel  $\text{CO}_2$  and then excess  $0.1 \text{ N NaOH}$  added and the filtrate from magnesium precipitate back titrated with  $0.1 \text{ N HCl}$ . The  $\text{Mg}/2$  was calculated from the used  $0.1 \text{ N NaOH}$  and the  $\text{K}$  obtained by difference. Additional data for this system are given by Nanty, 1911.

THE SYSTEM MAGNESIUM CARBONATE - AMMONIUM CARBONATE -  
WATER AT 30°  
(Lafontaine, 1925)

To a concentrated solution of magnesium bicarbonate containing 20-25 grams  $\text{Mg}(\text{HCO}_3)_2$  per liter, increasing quantities of ammonia, ammonium bicarbonate or of mixtures of the two were added. The solutions were agitated mechanically 10 hours per day for 8 days. The composition of the solid phase did not change but its quantity increased with time. The zones of formation of the several solid phases were determined.

EQUILIBRIUM IN THE SYSTEM MAGNESIUM CHLORIDE, MAGNESIUM  
OXIDE AND WATER

(Results of Bury and Davies, 1932 at 25°)

Due to the formation of either cement or gels equilibrium is reached very slowly. Continuous shaking for two months is required. It is also necessary to keep the solid phase reduced to a fine powder by repeatedly breaking up the lumps. In order to avoid metastable equilibrium it is necessary to add a trace of finely ground magnesium cement which contains hydroxide and oxychloride. The MgO contained about 0.3% CaO. It was prepared by heating magnesium carbonate (light) to 850°. MgO which has been heated to higher temperatures or "burnt" is very slow in attaining equilibrium. Both the filtered saturated solutions and the solid phases were analyzed. The identities of the latter were ascertained by extrapolation by the Jancke method.

\* = Metastable

1.3.11 = MgCl<sub>2</sub>·3MgO·11H<sub>2</sub>O.

The authors consider that Robinson and Waggamans value for the triple point Mg(OH)<sub>2</sub> + 1.3.11, viz. 16.0% MgCl<sub>2</sub> (below), erroneous due to their failure to recognize metastable equilibrium.

In a later paper, Bury and Davies, 1933, give results for the four component (reciprocal Salt pair) system MgCl<sub>2</sub> + CaO + H<sub>2</sub>O at 25°. The authors discuss these results in their relation to the properties of magnesium oxychloride cements.

SOLUBILITY OF BASIC MAGNESIUM CHLORIDE IN WATER AT 25°  
(Robinson and Waggaman, 1909)

An excess of MgO was shaken with each of 20 MgCl<sub>2</sub> solutions at 25° for six months and the supernatant clear solutions and solid phases with adhering liquid, analyzed. The solutions were titrated with 0.02 N HCl for dissolved MgO (present as Mg(OH)<sub>2</sub>). The composition of the solid phase in each case was ascertained by plotting the analytical results on a triangular diagram.

## EQUILIBRIUM IN AQUEOUS SOLUTIONS CONTAINING MAGNESIUM CHLORIDE AND VARIOUS OTHER SALTS

Several exhaustive papers describing the heterogeneous systems encountered in the technical production of particular salts from oceanic salt deposits have appeared. Among these should be mentioned those of Janecke, 1917, 1918, Serowy, 1923 and Frowein and von Muhlendahl, 1926. The experiments of Serowy are a repetition with great care, and an extension of the fundamental work of Van't Hoff, D'Ans and others. The compositions of the solutions saturated at regular intervals of temperature between 0° and 120° with all possible combinations of the solid phases, are shown in tables and triangular diagrams. The results are expressed in ion percent of the constituents of the salts, Mg, K, Na, Cl and SO<sub>4</sub>, and are also calculated to the molecular percent and weight percent basis and by the aid of density determinations, which are also given, to grams per liter. The paper of Janecke gives an exhaustive treatment of equilibria in heterogeneous systems. That of Frowein and von Muhlendahl is concerned particularly with double ternary mixtures derived from Mg, K<sub>2</sub>, Na<sub>2</sub>(NO<sub>3</sub>)<sub>2</sub> and Cl<sub>2</sub>.

This system has been studied in considerable detail by several investigators. In addition to the results given below, see Kupper, 1927 for data at 17 temperatures between 0° and 83°; also Pel'sh, 1949, 1953, 1953a who studied the system at low temperatures (-10° to +35°); other results in this range (-14° to +25°) are given by Druzhinin, Nikolaev et al. (1949), and by Feigelson and Bergman, 1940 (-20° to +25°). For further data at 25° see Levina, 1935; at 55° Tollert, 1952; at 0° and 50° Leinbach and Pfeiffenberger, 1929, 1930; at 110° Tanaka, Takasago and Komatsu, 1950; Zdanovskii, 1949.

## THE SYSTEM MAGNESIUM CHLORIDE - AMMONIUM CHLORIDE - WATER (Woskrassenski, 1934)

The author also made a long series of determinations by the freezing-point method (observing the temperature of the appearance of first crystal) and from these results obtained the values for the isotherms at -10°, -20°, -25°, as well as for the invariant points of the system at other temperatures.

(\*) Blitz and Marcus, 1911

(\*) Blitz and Marcus, 1911

The specific volumes and heat capacities of solutions of Magnesium Chloride and ammonium nitrate in water are given by Rutakov, 1948.

#### THE SYSTEM MAGNESIUM CHLORIDE - SODIUM CHLORIDE - WATER

The eutectic of the system  $\text{MgCl}_2 + \text{NaCl} + \text{H}_2\text{O}$  is at  $-35^\circ$ , 1.56% NaCl, 22.71%  $\text{MgCl}_2$  with solid phases: Ice +  $\text{NaCl} \cdot 2\text{H}_2\text{O}$  +  $\text{MgCl}_2 \cdot 12\text{H}_2\text{O}$ . The invariant solution in equilibrium with  $\text{MgCl}_2 \cdot 12\text{H}_2\text{O}$  +  $\text{NaCl} \cdot 2\text{H}_2\text{O}$  + NaCl ( $-26^\circ$ ) contains 1.81% NaCl and 23.35%  $\text{MgCl}_2$ . (Luzhnaja and Vereshchchina, 1946) Careful cryoscopic determinations are given by Mun and Daner, 1957.

Data for the system  $\text{MgCl}_2 - \text{NaCl} - \text{H}_2\text{O}$  up to  $200^\circ$  are given by d'Ans and Sypiana, 1942.

## THE SYSTEM MgCl<sub>2</sub> - NaCl - CaCl<sub>2</sub> - H<sub>2</sub>O BELOW 30°

(Lushnaja and Verehtetina, 1946)

The authors studied the system at low temperatures by observing the temperature of initial crystallization upon cooling. They present data at constant ratios of CaCl<sub>2</sub>:MgCl<sub>2</sub> with varying amounts of NaCl present. The following 3 phase equilibria were extracted from the tables.

Temp.°	Gms. per 100 gms. sat. sol.			Solid Phase
	CaCl <sub>2</sub>	MgCl <sub>2</sub>	NaCl	
-21.5	3.50	3.50	16.0	Ice + NaCl·2H <sub>2</sub> O

-25.0	14.65	14.65	1.60	"
-27.5	22.28	7.42	1.70	"
-38.3	5.69	17.09	0.32	Ice + MgCl <sub>2</sub> ·12H <sub>2</sub> O
-42.5	12.18	12.18	1.38	"
-17.5	8.28	24.86	0.56	MgCl <sub>2</sub> ·12H <sub>2</sub> O + NaCl·2H <sub>2</sub> O
-27.0	14.82	14.82	0.65	"
-30.0	13.15	13.15	1.42	"
-35	0.0	22.71	1.56	Ice + MgCl <sub>2</sub> ·12H <sub>2</sub> O+NaCl·2H <sub>2</sub> O
-26	0.0	23.35	1.81	MgCl <sub>2</sub> ·12H <sub>2</sub> O+NaCl·2H <sub>2</sub> O+NaCl

The Quaternary Eutectic is about -58° with a ratio of about 17:83 MgCl<sub>2</sub>:CaCl<sub>2</sub> in solution.

For a discussion and calculation of the crystallization area of NaCl in this system see Mun and Yarym-Agaev, 1957.

Results for the systems  $\text{MgCl}_2 + \text{NaCl} + \text{Na}_2\text{SO}_4 + \text{NaNO}_3 + \text{H}_2\text{O}$  ( $10^\circ$ ,  $50^\circ$ ) and  $\text{MgCl}_2 + \text{NaCl} + \text{Na}_2\text{SO}_4 + \text{NaNO}_3 + \text{Mg}(\text{NO}_3)_2 + \text{H}_2\text{O}$  ( $50^\circ$ ) are given by Leinbach and Pfeiffenberger, 1929, 1930.

THE SYSTEM MAGNESIUM CHLORIDE - STRONTIUM CHLORIDE - WATER  
(Assarsson and Balder, 1954a)

There are no double salts in the system between  $18^\circ$  and  $100^\circ$ . The transition  $\text{SrCl}_2 \cdot 6\text{H}_2\text{O} \rightarrow \text{SrCl}_2 \cdot 2\text{H}_2\text{O}$  occurs at  $19.4^\circ$ , in solution containing 1.3%  $\text{SrCl}_2$  and 34.7%  $\text{MgCl}_2$ . The transition  $\text{SrCl}_2 \cdot 2\text{H}_2\text{O} \rightarrow \text{SrCl}_2 \cdot \text{H}_2\text{O}$  occurs at  $80.5^\circ$ , with 1.7%  $\text{SrCl}_2$  and 39.1%  $\text{MgCl}_2$  in solution. The authors present the following diagram:

# Mg MAGNESIUM

THE SYSTEM  $\text{MgCl}_2 + \text{Na}_2\text{S}_2\text{O}_3 \rightleftharpoons \text{MgS}_2\text{O}_3 + 2\text{NaCl} (+\text{H}_2\text{O})$  AT 25°

### CrO MAGNESIUM CHROMATE $\text{MgCrO}_4$

#### SOLUBILITY OF MAGNESIUM CHROMATE IN WATER (Hill, Soth, and Ricci, 1940a)

Each result is the mean of a determination in which equilibrium was approached from supersaturation, and one in which it was approached from undersaturation. A very finely divided solid phase was produced at 75° upon long stirring, but its composition was not determined, and the pentahydrate may be metastable at this temperature.

CrO

SOLUBILITY IN WATER  
(Costa and Hartford, 1957)

The transition between the hexa- and penta-hydrates is not discernable in the solubility curve. It was found to be  $48.5 \pm 0.5^\circ$  by analysis of the solid phases at each temperature. The heat of transition is about 0.20 kcal/mole.

## Mg MAGNESIUM

### I MAGNESIUM IODIDE $\text{MgI}_2$

#### SOLUBILITY IN WATER (Menschutkin, 1905, 1907)

The salt was prepared by the action of water upon magnesium iodide dietherate by which the octahydrate and not the hexahydrate is formed. The crystals of this hydrate melt at  $43.6^\circ$ . The solubility determinations were made by the synthetic method.

### I MAGNESIUM IODIDE DIETHERATE $\text{MgI}_2 \cdot 2(\text{C}_2\text{H}_5)_2\text{O}$

This compound was studied in detail by B. N. Menschutkin. (Monograph in the Russian Language entitled "On Etherates and Other Molecular Combinations of Magnesium Bromide and Iodide," St. Petersburg, 1907, pp. 267 + XLVIII. Also published in "Memoirs of the St. Petersburg Polytechnic Institute," vols. 1-7, 1904-07 and in condensed form in vols. 49-67 of the Zeit. anorg. Chem., 1906-09.)

Preparation of Material. The dietherate of magnesium iodide,  $\text{MgI}_2 \cdot 2(\text{C}_2\text{H}_5)_2\text{O}$  was prepared by the very gradual addition of iodine to a mixture of magnesium and dry ether. The reaction is not so violent as that which takes place during the preparation of the magnesium bromide dietherate. Two liquid layers are present at the end of the reaction and by slight cooling beautiful white needle-like crystals separate from the lower one. The growth of these crystals is also accompanied, as in the case of the magnesium bromide compound, by an evolution of either droplets. Magnesium iodide dietherate is very hygroscopic, it is less stable than magnesium bromide dietherate, and becomes yellowish even after several hours, and brown after a day, owing probably to separation of iodine. As in the case of the magnesium bromide compound it reacts with very many organic compounds as alcohols, acids, ketones, etc., with liberation of ether and formation of addition products. These latter constitute the material used for the solubility studies.

Explanation of Results. As is seen from the following table, the solubility increases much more rapidly with temperature than in the case of magnesium bromide dietherate, especially in the vicinity of the melting point of  $\text{MgI}_2 \cdot 2(\text{C}_2\text{H}_5)_2\text{O}$  under its ethereal solution, which is at

23.6°. At this temperature there appears two layers, the lower one of which may be considered as a solution of ether in dietherate, and the upper one as a solution of the lower layer in ether. By increase of temperature a point is reached, at which both layers are miscible in all proportions (critical point). In the case of magnesium bromide dietherate no such critical point could be obtained. Both layers may be cooled below 23.6°, but only to about +15° since here spontaneous crystallization of the dietherate almost always occurs, and the temperature rises to 23.6°. The great tendency to crystallize is probably due to the difference between the composition of the lower layer and of the saturated solution of the dietherate. The determinations in the vicinity of the critical point were quite difficult to make on account of the considerable opalescence which occurred and also the formation of a white substance, the nature of which was not ascertained. The critical concentration, as determined by means of the law of straight averages of Caillietet and Mathias, was approximately 40.3 percent  $\text{MgI}_2 \cdot 2(\text{C}_2\text{H}_5)_2\text{O}$ ; the temperature, 38.5°. At concentrations of  $\text{MgI}_2 \cdot 2\text{C}_4\text{H}_{10}\text{O}$  greater than 54 percent, a single liquid is again formed and the solubility curve can be followed up to the melting point of the dietherate at 51°.

The more recent work of Stewart and Ubbelohde, 1949 is in excellent agreement with Menschutkin's. S. and U. used nitrogen atmospheres, and kept the mixtures in the dark to prevent photodecomposition.

100 gms. sat. solution of Magnesium Iodide in Liquid Ammonia contain 0.156 gm. MgI<sub>2</sub> at 0°.

(Linhard and Stephan, 1933, 1934)

Melting points in the systems MgI<sub>2</sub> + KI and MgI<sub>2</sub> + NaI are given by Beyersdorfer and Oryschkewitsch (1948) and by Klemm (1948).

**MAGNESIUM IODOMERCURATE MgI<sub>2</sub>·2HgI<sub>2</sub>·7H<sub>2</sub>O**

The sat. solution in water at 17.8° has the composition MgI<sub>2</sub>·1.29HgI<sub>2</sub>·11.06 H<sub>2</sub>O and Sp. Gr. 2.92.

(Duboin, 1906)

# Mg MAGNESIUM

## 10 MAGNESIUM IODATE $\text{Mg}(\text{IO}_3)_2$

### SOLUBILITY OF MAGNESIUM IODATE IN WATER (Hill and Moskowitz, 1931)

The previous determinations of Mylius and Funk, 1897, 1900, are shown to be incomplete.

\*At temperatures above the tr. pt. 29.5°, hydrolysis of the salt occurs with rapid decomposition of the solution.

MAGNESIUM NITRATE  $\text{Mg}(\text{NO}_3)_2$ 

NO

SOLUBILITY OF MAGNESIUM NITRATE IN WATER  
(Sievverts and Petzold, 1932; Ewing, Brander, Slichter and  
Griesinger, 1933)

The closely agreeing results of the above investigators made by the freezing-point and direct solubility methods, were plotted and the following values taken from the average curve.

It may be noted that several individual determinations (at  $0^\circ$ ,  $25^\circ$ ) are higher than those listed below. See for example, Urazov and Shevtsova, 1957; Ewing and Klinger, 1935; DiCapua, 1929, etc. in the pages following.

1942.

## Mg MAGNESIUM

### NBO MAGNESIUM NIOBATES $Mg(NbO_3)_2$ (meta)

For the metavanadate at 20°,  $K_{sp} = 2.3 \times 10^{-17}$ , as determined with radio tracers.

(Lapitakii and Pchelkin, 1956)

### O MAGNESIUM OXIDE $MgO$

### OH MAGNESIUM HYDROXIDE $Mg(OH)_2$

#### SOLUBILITY IN WATER

According to Gjalbaek, 1925, magnesium hydroxide exists in two well defined modifications of which the more easily soluble is the labil form and the more difficultly soluble is the stable form. The labil form is obtained by precipitating magnesium salts with bases, by hydration of magnesium oxide and by replacement between metallic magnesium and water. The stable magnesium hydroxide is formed from the labil. The change (recrystallization) goes quickly at high magnesium concentrations and slower at lower concentrations.

The following comparative results are reported. Temp. 18°.

Method	Minimum Solubility (stable)	Maximum Solubility (labil)
Direct solubility determination	$2.2 \times 10^{-4}$	$6.5 \times 10^{-4}$
$Mg^{++} + 2NH_4OH \rightleftharpoons Mg(OH)_2 + NH_4^+$	$1.9 \times 10^{-4}$	$5.5 \times 10^{-4}$
Conductivity method	$(1.35 \times 10^{-4})$	$4.6 \times 10^{-4}$
Electrometric method	$1.6 \times 10^{-4}$	$7.0 \times 10^{-4}$

A further comparison of the solubilities of naturally occurring and freshly precipitated  $Mg(OH)_2$  was made by Quatarol and Belfiori, 1941. Aging decreases the solubility of the precipitate.

For P-T equilibrium data in the system  $MgO - H_2O$  see Roy and Roy, 1957.

Results at Several Temperatures.

The data of various authors is in only fair agreement, see above. Travers and Nouvel, 1929 (TN) used crystalline  $\text{Mg}(\text{OH})_2$  and the determinations were made in a copper flask or copper lined autoclave at higher pressures. The dissolved magnesia was determined by the electrometric method (hydrogen electrode) and also by direct titration using phenol red as indicator and operating in an atmosphere free of  $\text{CO}_2$ . Remy and Kuhlmann, 1924 (RK) prepared a saturated solution by agitating freshly ignited  $\text{MgO}$  with conductivity water for 4 hours, taking great care to exclude  $\text{CO}_2$ . Conductimetric analyses were made. Oka, 1940 (O) made potentiometric titrations. Other data are by Busch, 1927 (B), Makarov and Vol'nov, 1954 (MV), Whitby, 1933 (W), Gjalbaek, 1925 (G), Kohbranch (K), Nasanen, 1941 (N), Feitknecht and Studer, 1949 (FS).

## SOLUBILITY OF MAGNESIUM HYDROXIDE IN SALT SOLUTIONS

In aq.  $\text{NH}_3$  +  $\text{NH}_4\text{Cl}$  at  $18^\circ$ 

(Fredholm, 1934)

Paraffined flasks were used and  $\text{CO}_2$  carefully excluded. In order to approach equilibrium from both sides a part of the mixtures were prepared by adding  $\text{NH}_3$  and  $\text{NH}_4\text{Cl}$  to aqueous  $\text{MgCl}_2$  solutions and the others (last three in table) by adding an excess of carefully prepared  $\text{Mg}(\text{OH})_2$  to  $\text{NH}_4\text{Cl}$  solutions. The solutions were shaken from 2 to 8 days. The clear saturated solutions were analyzed for  $\text{Mg}$ ,  $\text{NH}_3$ , and  $\text{NH}_4^+$ .

# Mg MAGNESIUM

## SOLUBILITY OF MAGNESIUM HYDROXIDE IN SALT SOLUTIONS--Cont.

### In aq. $\text{MgCl}_2$ at $30^\circ$

(Lukens, 1932)

Magnesium oxide dissolves in aqueous  $\text{MgCl}_2$  solutions with subsequent precipitation of a compound of the composition  $5\text{MgO} \cdot \text{MgCl}_2 \cdot x\text{H}_2\text{O}$ . The rate of the reaction is influenced by the previous heat treatment of the  $\text{MgO}$  and the temperature at which the reaction occurs. The compound initially precipitated is transformed by continued contact with  $\text{MgCl}_2$  solutions of Sp. Gr. above 1.16, to a new compound,  $5\text{MgO} \cdot \text{MgCl}_2 \cdot y\text{H}_2\text{O}$ , containing a different amount of water. The water content,  $x$  and  $y$ , of these compounds could not be determined.

O

OH In previous studies of this system at  $25^\circ$  and at  $50^\circ$  by Maeda and Yarmane, 1928, the authors reported the composition of the compound formed to be,  $3\text{MgO} \cdot \text{MgCl}_2 \cdot 12\text{H}_2\text{O}$ .

d'Ans and Katz, 1941 showed that the solubility of  $\text{Mg}(\text{OH})_2$  increases with increasing  $\text{MgCl}_2$  in solution.

### In aq. $\text{MgSO}_4$

(Kiessewetter, 1953)

Various concentrations of  $\text{MgSO}_4$  were used, and factors such as stirring time, flocculation, rate of dissolving, etc. were considered.

### In aq. $\text{NaCl}$ , $\text{Na}_2\text{SO}_4$ at high temperature

(Travers and Nouvel, 1929)

The presence of  $\text{NaCl}$  and of  $\text{Na}_2\text{SO}_4$  increase the solubility. Thus in an aqueous solution of 1.0 gm.  $\text{Na}_2\text{SO}_4$  per 100 cc, the solubility of the  $\text{Mg}(\text{OH})_2$  is 0.000238 gm. mols. per liter at  $110^\circ$  and 0.000142 gm. mols. at  $160^\circ$ .

### In aq. potassium salts at $25^\circ$

Whitby, 1933, gives results for the solubility of  $\text{Mg}(\text{OH})_2$  in aqueous solutions of  $\text{KOH}$ ,  $\text{KCl}$ ,  $\text{KBr}$ ,  $\text{KI}$  and  $\text{K}_2\text{SO}_4$  at  $25^\circ$ .

(Results of Maljaroff and Matakiewitsch, 1934)

An excess of  $\text{MgNH}_4\text{PO}_4 \cdot 6\text{H}_2\text{O}$ , made from  $\text{MgCl}_2$ , was shaken at room temperature with each of the salt solutions and from time to time the content of phosphate was determined. Equilibrium was reached after a short (?) time. The content of magnesium ammonium phosphate was determined by titration with 0.1 N  $\text{HCl}$  using methyl orange as indicator.

### 51 MAGNESIUM SULFATE $\text{MgSO}_4$

#### SOLUBILITY OF MAGNESIUM SULFATE IN WATER

This system is complicated by the great range of temperature over which the hexa and penta (?) hydrates exist in metastable equilibrium. Of the large number of determinations which have been made, those of de Coppet, 1872 (ice curve); Cottrell et.al., 1901 (Eutectic); Kupper, 1927; Schroder, 1929; Ting and McCabe, 1934; Robson, 1927; Froehlich, 1929; and Smith, Rinse and Lowe-Kooymans, 1928 were plotted and the following values read from the average curve.

1·1·3 = MgSO<sub>4</sub>·H<sub>2</sub>SO<sub>4</sub>·3H<sub>2</sub>O; 1·3 = MgSO<sub>4</sub>·3H<sub>2</sub>SO<sub>4</sub>

Results for this system at 0°, 19° and 35.5° are given by Arditti, 1933, in the form of a diagram but without the numerical values. The author reported the solid phases to be MgSO<sub>4</sub>·7H<sub>2</sub>O, MgSO<sub>4</sub>·H<sub>2</sub>SO<sub>4</sub>·3H<sub>2</sub>O, MgSO<sub>4</sub>·H<sub>2</sub>SO<sub>4</sub>, 3MgSO<sub>4</sub>·2H<sub>2</sub>SO<sub>4</sub> and 3MgSO<sub>4</sub>·H<sub>2</sub>SO<sub>4</sub>.

Batuner, 1938 found that 100 gms. of a saturated solution, containing 50 gms. of H<sub>2</sub>SO<sub>4</sub>, contained 4.25 gms. MgSO<sub>4</sub> at 35°, 45°, 55°, and 65°. The solid phase was MgSO<sub>4</sub>·H<sub>2</sub>O.

Polytherms from 10 to 90°, and the 65° isotherm of the system MgSO<sub>4</sub> - H<sub>2</sub>BO<sub>3</sub> - H<sub>2</sub>O were determined by Manole - Bezhan and Sokolovskii, 1951.

THE SYSTEM MAGNESIUM SULFATE - MAGNESIUM HYDROXIDE - WATER  
Results of Delyon, 1936

Aqueous solutions of MgSO<sub>4</sub> containing more than 500 gms. per liter dissolve MgO with formation of the oxy sulfate, MgSO<sub>4</sub>·3MgO·11H<sub>2</sub>O. The author studied the influence of the mode of preparation of the MgO, the concentration of MgSO<sub>4</sub> and the temperature upon this reaction. The results show the amount of MgO dissolved under given conditions. For example it was found that one liter of an aqueous solution containing 500 gms. MgSO<sub>4</sub>, dissolves 4.2 gms. MgO at 60°.

## THE SYSTEM MAGNESIUM SULFATE - CALCIUM SULFATE - WATER

(See also Vol. I, p. 673,4)

Results at 35°  
(Novikova, 1957)

Solubilities of  $\text{CaSO}_4$  were determined by precipitation with alcohol and by radioactive tracers. The alcohol method gave higher results, probably due to coprecipitation. The  $\text{CaSO}_4$  solubility curve is S-shaped. Results by the tracer method are given below.

Sat. Sol. wt. %		Solid Phase	Sat. Sol. wt. %		Solid Phase
$\text{CaSO}_4$	$\text{MgSO}_4$		$\text{CaSO}_4$	$\text{MgSO}_4$

\*Hill, Durham, and Ricci, 1940; d. = 1.090.

THE SYSTEM MAGNESIUM SULFATE - SODIUM SULFATE - WATER.

The system has been studied by several authors with reasonable agreement among the data. In addition to the results given below, Zdanovskii (1949) reviews the results of the Institute of Salt Science (USSR) from 0° to 35°. For other data see Roozeboom, 1887, 1888; D'Ans, 1915; Pel'sh, 1953; Levina, 1938a; and Blasdale and Robson, 1938. The latter authors give a diagram composed of the isotherms constructed from their own and other results. From this the composition of any stable solution in equilibrium with one or more solid phases can be found for any temperature between 0° and 210°.

A similar presentation of all available determinations upon this system, up to 1929, calculated to both the weight percent and gram mole basis, is given by Froelisch, 1929.

The results in parentheses (0°, 25°) are by Kournakow and Zemcuznyj, 1919, 1924.

#### THE SYSTEM MAGNESIUM SULFATE - NICKEL SULFATE - WATER

Continuous solid solutions are formed between 0° and 100°. According to Benrath and Neumann, 1939, the solid phases have the following composition:

t°	
Below 29.1	Continuous Solid Solution $(\text{Mg}, \text{Ni})\text{SO}_4 \cdot 7\text{H}_2\text{O}$
29.1 to 44	Solid Solutions $(\text{Mg}, \text{Ni})\text{SO}_4 \cdot 7\text{H}_2\text{O}$ and $(\text{Mg}, \text{Ni} \cdot \alpha)\text{SO}_4 \cdot 6\text{H}_2\text{O}$
44 to 48	Solid Solutions $(\text{Mg}, \text{Ni})\text{SO}_4 \cdot 7\text{H}_2\text{O}$ , $(\text{Mg}, \text{Ni} \cdot \beta)\text{SO}_4 \cdot 6\text{H}_2\text{O}$ , and $(\text{Mg}, \text{Ni} \cdot \alpha)\text{SO}_4 \cdot 6\text{H}_2\text{O}$
48 to 60.3	Solid Solutions $(\text{Mg}, \text{Ni} \cdot \beta)\text{SO}_4 \cdot 6\text{H}_2\text{O}$ and $(\text{Mg}, \text{Ni} \cdot \alpha)\text{SO}_4 \cdot 6\text{H}_2\text{O}$
60.3 to 68	Continuous Solid Solution $(\text{Mg}, \text{Ni} \cdot \beta)\text{SO}_4 \cdot 6\text{H}_2\text{O}$

# Mg MAGNESIUM

## SOLUBILITY OF MAGNESIUM SULFATE IN AQUEOUS SOLUTIONS OF ISO PROPYL ALCOHOL AT 25° (Ginnings and Chen, 1931)

The results locate the binodal curve of the system, including a tie line, \*, which shows the composition of two liquid layers in contact with each other, and the plait point, PP, at which the two liquid layers become homogeneous.

	Gms. per 100 gms. sat. sol.		Gms. per 100 gms. sat. sol.	
	Iso C <sub>3</sub> H <sub>7</sub> OH	MgSO <sub>4</sub>	Iso C <sub>3</sub> H <sub>7</sub> OH	MgSO <sub>4</sub>
50	39.30	1.43*	12.10	11.80
	32.80	2.77	9.40	14.00
	28.40	4.20	7.10	16.40
	23.70	5.90	5.00	19.40
	21.4	7.3 PP	3.00	22.50*

The composition of the homogeneous mixture, Plait point, PP, of the system MgSO<sub>4</sub> + Tertiary Butyl Alcohol + H<sub>2</sub>O at 25° was found by Ginnings, Herring and Webb, 1933 to be 3.3 percent MgSO<sub>4</sub> + 27.2 percent ter. (CH<sub>3</sub>)<sub>3</sub>COH + 69.5 percent H<sub>2</sub>O. The original results for the remaining points on the binodal curve are not given but only the values of constants calculated from empirical equations.

The binodal curve of the system MgSO<sub>4</sub> + Allyl Alcohol + H<sub>2</sub>O at 25° has been determined by Ginnings and Dees, 1935; and that for the system MgSO<sub>4</sub> + Pyridine + H<sub>2</sub>O at 25° has been determined by Ginnings, Webb and Hinohara, 1933. The authors do not give their experimental results but only the values of a series of arbitrary constants calculated from them by means of empirical equations. The results showed that allyl alcohol is more difficult to salt out than iso propyl or normal propyl alcohol.

## THE SYSTEM MAGNESIUM SULFATE - UREA - WATER (Salaimankulov, Druzhinin and Bergman, 1957 (0, 30, 45°); Whittaker, Lundstrom and Shimp, 1936 (30°); Salaimankulov and Bergman, 1957 (eutec. to +20°))

Salaimankulov and Bergman present a polythermal diagram for the system from the eutectic to +20°.

Melting point data are given for:

$MgSiO_3 + MnSiO_3$	Lebedew, 1911
$MgSiO_3 + Na_2SiO_3$	Wallace, 1909
$Mg_2SiO_4 + Mg_2GeO_4$	Ringwood, 1956
$Mg_2SiO_4 + Ca_2SiO_4$	Toropov and Shchetnikova, 1957, 1957a

## MANGANESE Mn

SOLUBILITY OF MANGANESE IN MERCURY AT 20°  
(Irvin and Russell, 1932)

An amalgam of 1 gm. Mn in 200 gms. Hg was passed through a sintered glass filter and the manganese in the weighed filtrate found to correspond to a solubility of 0.001 percent with an error of 10%. A determination by Tammann, Kollmznn and Hinuber, 1927, by the electrometric method, gave 0.00025 gm. Mn per 100 gm. Hg.

For data on the system Mn-C, see Isobe, 1951.

## MANGANESE ARSENATES

AsO

THE SYSTEM  $MnO - As_2O_5 - H_2O$ 

The results of Takahashi and Sasaki, 1953 at 30° are in good agreement with those of Amadori, 1922 at 25°. The data of Grube, Heller and Herrmann (25°) obtained from supersaturation ( $MnCO_3$  added to  $H_3AsO_4$  solutions) are apparently incorrect.

At 75°, Kuperman and Belopol'skii, 1955 found  $MnHASO_4 \cdot 4H_2O$  in contact with solutions containing up to 40%  $As_2O_5$ . At 25° the monohydrate  $MnHASO_4 \cdot H_2O$  is reported over the same range of concentration (T. and S., A.). In addition, Grube et al reported finding the 4-hydrate but not the 1-hydrate at 25°. Thus both hydrates probably exist but their stability relations are not certain.

Results at 25°  
(Amadori, 1922)

THE SYSTEM MANGANESE CHLORIDE - AMMONIUM CHLORIDE - WATER

This system has been studied extensively with generally good agreement among the results. The double salt MnCl<sub>2</sub>·2NH<sub>4</sub>Cl·2H<sub>2</sub>O is found which forms solid solutions with NH<sub>4</sub>Cl and to some degree with MnCl<sub>2</sub>. At some temperatures these are three series of solid solutions that are all dihydrated. MnCl<sub>2</sub>·4H<sub>2</sub>O exists as a pure solid. The data of Foote and Saxton, 1914 and Clendinnen and Rivett, 1921 (below) are typical.

In addition, Clendinnen and Rivett, 1921 give data at 25°, and in 1923 give results upon a critical solution temperature for solids in the binary system ammonium chloride-manganous chloride dihydrate. Eight isotherms between 10° and 60° were studied and the results of the analyses of the solutions and wet solid phases are given. The percentage of ammonium chloride in the solution and solid phases were plotted and the isothermal distribution curves thus obtained. These show regions of homogeneous single-phase mixed crystals and also a heterogeneous region. This latter was studied in considerable detail.

## Mn MANGANESE

Other data in agreement with these are given by Kurnakow and Woskressenskaya, 1937 at 25°, Greenberg and Walden, 1940 and Grenall, 1949. The latter authors (G. and W., G.) made x-ray studies of the solid phases. The results of Benrath and Schackmann, 1935 may be in error.

### Results at 25° (Foote and Saxton, 1914)

$\alpha$  mixed crystals consist of  $\text{NH}_4\text{Cl}$  with varying amounts of  $\text{MnCl}_2 \cdot 2\text{H}_2\text{O}$ ;  $\beta$  mixed crystals consist of the double salt  $2\text{NH}_4\text{Cl} \cdot \text{MnCl}_2 \cdot 2\text{H}_2\text{O}$  with excess of  $\text{NH}_4\text{Cl}$ .

Cl	Gms. per 100 gms. sat. sol.		Solid Phase	Gms. per 100 gms. sat. sol.		Solid Phase

	19.75	16.02		2.98	43.71	
	19.67	15.47		2.94	43.44	

### Results at 60° (Clendinnen and Rivett, 1921)

The solid phases lie on the line connecting the compositions of pure ammonium chloride and the dihydrate of manganous chloride. The system is of a somewhat uncommon type. There are three very well-defined series of mixed crystals, namely, AF, GH, and KD with two gaps, FG and HK. The composition of the alleged compound  $2\text{NH}_4\text{Cl} \cdot \text{MnCl}_2 \cdot 2\text{H}_2\text{O}$  is well within the second series GH.

### SOLUBILITY OF MANGANESE CHLORIDE IN OTHER SOLVENTS

100 cc of a saturated solution of  $\text{MnCl}_2$  in a mixture of equal volumes of ethyl ether and water, saturated with  $\text{HCl}$  at 0°, contain 0.86 gms.  $\text{MnCl}_2$ .

(Fischer and Seidel, 1941)

100 gms. sat. solution of manganese chloride in selenium oxychloride ( $\text{SeOCl}_2$ ) contain 0.16 gm.  $\text{MnCl}_2$  at  $25^\circ$ .

(Wise, 1923)

100 cc. anhydrous hydrazine dissolve 13 gms.  $\text{MnCl}_2$  at about  $20^\circ$ .

(Welsh and Broderson, 1915)

100 gms. pyridine dissolve 1.28 gms.  $\text{MnCl}_2$  at  $0^\circ$  and 1.06 gms. at  $25^\circ$ .

(Miller, R., 1924)

Melting point data are given for:

$\text{MnCl}_2 + \text{PbCl}_2$	(Sandonnini, 1911, 1914)
$\text{MnCl}_2 + \text{SnCl}_2$	(Sandonnini, 1911; Sandonnini and Scarpa, 1911)
$\text{MnCl}_2 + \text{ZnCl}_2$	(Sandonnini, 1912, 1914)
$\text{MnCl}_2 + \text{TlCl}$	(Gromakov, 1951)
$\text{MnCl}_2 + \text{RbCl}$	(Markov and Chernov, 1958)
$\text{MnCl}_2 + \text{CsCl}$	(Markov and Chernov, 1958)

#### MANGANESE PERCHLORATE $\text{Mn}(\text{ClO}_4)_2 \cdot 6\text{H}_2\text{O}$

C10

SOLUBILITY OF MANGANESE PERCHLORATE IN SEVERAL SOLVENTS AT ABOUT  $20^\circ$

(Chaney and Mann, 1931)

The determinations were made by adding, at room temperature, successive small amounts of solvent to a weighed amount of the salt until, upon vigorous shaking, the last trace of perchlorate just disappeared.

Solvent	Gms. $\text{Mn}(\text{ClO}_4)_2 \cdot 6\text{H}_2\text{O} (?)$ per 100 cc. solvent
Water	268*
Furfural ( $\text{C}_4\text{H}_3\text{OCHO}$ of $d_{20} = 1.550$ )	90
Cellosolve (Monoethyl ether of ethylene glycol)	130

\*Salvadori, 1912.

#### MANGANESE Hexa Antipyrine PERCHLORATE $\text{Mn}(\text{COC}_{10}\text{H}_{12}\text{N}_2)_6 \cdot (\text{ClO}_4)_2$

100 cc. sat. solution of the salt in water contain 3.63 gm.  $\text{Mn}(\text{COC}_{10}\text{H}_{12}\text{N}_2)_6 \cdot (\text{ClO}_4)_2$  at  $20^\circ$ .

(Wilke-Dorfurt and Schliephake, 1929)

# Mn MANGANESE

## F MANGANESE FLUORIDE $\text{MnF}_2$

SOLUBILITY IN WATER  
(Nuka, 1929; Ryss and Vitukhnovskaya, 1955)

Nuka did not identify the solid phase. His data agree with those found by Ryss and Vitukhnovskaya for the anhydrous salt. The tetrahydrate is stable below 23.5°. The result of Carter, 1928 is incorrect.

$t^\circ$	Gms. $\text{MnF}_2$ per 100 gms. sat. sol.	Solid Phase	$t^\circ$	Gms. $\text{MnF}_2$ per 100 gms. sat. sol.	Solid Phase

BF

100 cc. sat. solution of Manganese Hexa Antipyrine Fluoroborate in water contain 5.4 gms. Mn(COC<sub>10</sub>H<sub>12</sub>N<sub>2</sub>)<sub>6</sub> (BF<sub>4</sub>)<sub>2</sub> at 20°.  
(Wilke-Dorfurt and Mureck, 1929)

MANGANESE FLUOSILICATE MnSiF<sub>6</sub>·6H<sub>2</sub>O

SiF

100 gms. H<sub>2</sub>O dissolve 140 gms. of the salt at 17.5°. Sp. Gr. of the solution = 1.448.

(Stolba, 1883)

MANGANESE IODIDE MnI<sub>2</sub>

100 gms. Liquid Ammonia dissolve 0.02 gm. MnI<sub>2</sub> at 0°.

(Hunt and Boncyk, 1933)

# Mn MANGANESE

## I MANGANESE MERCURIC IODIDE $3\text{MnI}_2 \cdot 5\text{HgI}_2 \cdot 20\text{H}_2\text{O}$

A saturated solution of the salt in water at 17° has the composition  $1.4 \text{ MnI}_2 \cdot \text{HgI}_2 \cdot 10.22\text{H}_2\text{O}$  and density 2.98.

(Duboin, 1906)

## IO MANGANESE IODATE $\text{Mn}(\text{IO}_3)_2$

### SOLUBILITY IN VARIOUS SOLUTIONS

(Hayes and Martin, Jr., 1951)

## MOO MANGANESE AMMONIUM MOLYBDATE $\text{Mn}_2(\text{Mo}_2\text{O}_7)_3 \cdot 5(\text{NH}_4)_2\text{MoO}_4 \cdot 12\text{H}_2\text{O}$

100 gms.  $\text{H}_2\text{O}$  dissolve 0.98 gms. of the salt at 17°. (Struve, 1854)

## NO MANGANESE NITRATE $\text{Mn}(\text{NO}_3)_2$

### SOLUBILITY IN WATER

(Ewing and Rasmussen, 1942; Funk, 1900)

The more recent results are lower than those of Funk, and indicate the presence of four hydrates, but not the trihydrate previously reported.  $\text{Mn}(\text{NO}_3)_2 \cdot 6\text{H}_2\text{O}$  and  $\text{Mn}(\text{NO}_3)_2 \cdot 4\text{H}_2\text{O}$  are stable at their melting points. The data of Ewing and Rasmussen were obtained by the freezing point method.

(Ewing and Rasmussen, 1942)

(Funk, 1900)

# Mn MANGANESE

## SOLUBILITY OF MANGANESE HYDROXIDE IN ACIDIC AND BASIC SOLUTIONS AT 25° (Fox, Swinehart, and Garrett, 1941)

The determinations were made in an atmosphere of nitrogen. Each value is the average of a determination in which equilibrium was approached from undersaturation and one from supersaturation.

## SOLUBILITY OF MANGANESE HYDROXIDE IN AQUEOUS SOLUTIONS OF ORGANIC SALTS (Tamm, 1910)

(25 cc. of the neutral salt solution + 25 cc. of aqueous suspension of Mn(OH)<sub>2</sub> were shaken different lengths of time. Temp. not stated.)

100 cc. sat. solution in 1 n sodium tartrate solution contain 0.052 gm. Mn<sub>3</sub>O<sub>4</sub>.

100 cc. sat. solution in 1 n sodium malate solution contain 0.032 gm. Mn<sub>3</sub>O<sub>4</sub>.

100 cc. sat. solution in 1 n sodium citrate solution contain 0.095 gm. Mn<sub>3</sub>O<sub>4</sub>.

Fusion data for the system MnO + SiO<sub>2</sub> are given by Doernickel, 1907 and for the reaction  $2\text{MnO} + \text{Si} \rightleftharpoons 2\text{Mn} + \text{SiO}_2$  at 1640° by Herasymenko, 1938.

The solubilities of various soil phosphates (including manganese) under varying conditions were determined by Fraps, 1911.

MANGANESE HYPOPHOSPHITE  $\text{Mn}(\text{H}_2\text{PO}_2)_2 \cdot \text{H}_2\text{O}$ 

PO

100 gms.  $\text{H}_2\text{O}$  dissolve 15.15 gms. salt at 25°, and 16.6 gms. at b. pt.  
(U. S. P.)

Melting points for the system  $\text{Mn}_3\text{P}_2\text{O}_8 + \text{MnO}$  are given by Pearson, Turkdogan and Fenn, 1954.

MANGANESE SULFIDE  $\text{MnS}$ 

S

t°	Solubility Product	Author
25	$1.1 \times 10^{-15}$	(Kapatinsky, 1940)
25	$1 \times 10^{-11}$	(Goates, Gordon and Faux, 1952)

Purified manganese sulfide was agitated in 0.01  $\text{N}$   $\text{H}_2\text{SO}_4$  containing  $\text{H}_2\text{S}$  for 10 hours at 20°. The determination was repeated after another period of 10 hours. The sat. solution contained 0.4874 gm.  $\text{MnS}$ , corresponding to  $5.6 \cdot 10^3$  gm. mols.  $\text{MnS}$ , per 1000 cc.

(Moser and Behr, 1924)

## Mn MANGANESE

SO MANGANESE SULFATE  $\text{MnSO}_4$ 

## SOLUBILITY IN WATER

The stable phases are  $\text{MnSO}_4 \cdot 7\text{H}_2\text{O}$ ,  $\text{MnSO}_4 \cdot 5\text{H}_2\text{O}$ , and  $\text{MnSO}_4 \cdot \text{H}_2\text{O}$ . In addition, wholly metastable 4- and 2- hydrates are formed; the 2-hydrate was found by Rohmer, 1938. The agreement on the solubility of each hydrate is generally very good. The data between 23° and 42° are those given by Rohmer, 1938, at other temperatures, Krepelka and Rejha, 1933. Earlier results are reported by Cottrell, 1901 and Richards and Fraple, 1901. The values from 120° to 170° are those of Eddy, Machemer and Menzies, 1941. However, their data at 90-110° seem too high (not listed), and the results of Benrath, 1941 (107°-188°) are also high.

## THE SYSTEM MANGANESE SULFATE - SODIUM SULFATE - WATER

(0°, 25°, 35°, Caven and Johnston, 1928; 11°-50°, Benrath, 1929a;  
97°, Benrath and Benrath, 1929)

Caven and Johnston's results at 35° fail to confirm the existence of the double salts: MnSO<sub>4</sub>·3Na<sub>2</sub>SO<sub>4</sub> and 9MnSO<sub>4</sub>·10Na<sub>2</sub>SO<sub>4</sub> previously reported by Schreinemakers and Provijs, 1913, or of MnSO<sub>4</sub>·Na<sub>2</sub>SO<sub>4</sub>·4H<sub>2</sub>O.

Benrath considers that Caven and Johnston failed to find the 1.3 salt on account of the slowness with which it is formed in the vicinity of its transformation points.

# Mn MANGANESE

## THE SYSTEM MANGANESE SULFATE - THORIUM SULFATE - WATER AT 30° (Caven, 1932)

1.1.7 =  $\text{MnSO}_4 \cdot \text{Th}(\text{SO}_4)_2 \cdot 7\text{H}_2\text{O}$ . This double salt forms very slowly and could only be obtained by preparing a hot concentrated solution of thorium and manganese sulfates and stirring this for a long period at 30°. It cannot be recrystallized from  $\text{H}_2\text{O}$ .

1.1.6 =  $\text{MnSO}_4 \cdot \text{Tl}_2\text{SO}_4 \cdot 6\text{H}_2\text{O}$ ;

2.1 =  $2\text{MnSO}_4 \cdot \text{Tl}_2\text{SO}_4$

THE SYSTEM MANGANESE SULFATE - ZINC SULFATE - WATER AT 35°  
(Benrath and Blankenstein, 1934a)

The results are expressed in the Janecke System in terms of the gm. mole. H<sub>2</sub>O to dissolve 1.0 gm. mol. anhydrous salt mixture containing the reported percentage of MnSO<sub>4</sub>. Results for the isotherms 0°, 20°, 23°, 27.2°, 30°, 35°, 45° and 60° are given. Both the saturated solutions and moist solids were analyzed and the composition of the solid phase deduced from the results. The solid phases of mixed crystals over considerable regions and the limiting percentage of the constituents in these are shown. The following values at 35° are typical of the entire series.

Percent MnSO <sub>4</sub> in 1 mol. dissolved salt mixture	Mols. H <sub>2</sub> O to dissolve 1 mol. salt mixture	Crystalline Phase	SO
100.0	13.53	MnSO <sub>4</sub> ·H <sub>2</sub> O	
93.6 (98.1)	13.2 (1.0)	"	
81.6	12.5	"	
70	12.1	"	
59.6	11.63	" + MnSO <sub>4</sub> ·5H <sub>2</sub> O	
49.9	11.5	MnSO <sub>4</sub> ·5H <sub>2</sub> O	
43.3 (61.0)	11.3 (5.0)	"	
41.8	11.5	MnSO <sub>4</sub> ·5H <sub>2</sub> O	
38.0	11.4	" + ZnSO <sub>4</sub> ·6H <sub>2</sub> O	
37.8 (15.0)	12.0 (6.0)	ZnSO <sub>4</sub> ·6H <sub>2</sub> O	
34.0	11.8	"	
22.2 (5.5)	12.4 (7.0)	ZnSO <sub>4</sub> ·7H <sub>2</sub> O	
15.9	12.9	"	
5.69	13.3	"	
0.0	13.5	"	

The figures in parentheses are the limiting values respectively for MnSO<sub>4</sub>·H<sub>2</sub>O, MnSO<sub>4</sub>·5H<sub>2</sub>O, ZnSO<sub>4</sub>·6H<sub>2</sub>O and ZnSO<sub>4</sub>·7H<sub>2</sub>O in the mixed crystals composing the moist solid phases.

Additional data for the solubility of mixed crystals of manganese and zinc sulfates between 0° and 39° are given by Sehmen, 1905-06.

SOLUBILITY OF MANGANESE SULFATE IN AQUEOUS ETHYL ALCOHOL

### VO MANGANESE POTASSIUM VANADATE $\text{MnKV}_5\text{O}_{14} \cdot 8\text{H}_2\text{O}$

100 gms.  $\text{H}_2\text{O}$  dissolve 1.7 gms. salt at  $18^\circ$ .

(Radan, 1889)

## MOLYBDENUM Mo

### SOLUBILITY OF MOLYBDENUM IN MERCURY (Irvin and Russell, 1932)

An amalgam containing approximately 0.2 gm. of Mo per 200 gms. of Hg was prepared by electrolysis and allowed to stand two days. This was filtered and the molybdenum in the filtrate found to be less than 0.00002 percent.

The distribution of molybdenum between Fe and FeS at the eutectic temperature of the system was studied by Noddack, Noddack and Bohnstedt, 1940. The molybdenum was concentrated in the Fe layer.

### CH MOLYBDENUM OXINE, CUPFERRATE

50 ml of an aqueous  $\text{Mo}^{+6}$  solution containing 50-200  $\mu\text{g}$ . Mo were shaken for 1 minute with 10 ml. of 1% solution of 8-hydroxyquinoline (oxine) in  $\text{CHCl}_3$ . Extraction was complete between pH 1.6 - 5.6.

(Gentry and Sherrington, 1950)

Data for the extraction of  $\text{Mo}^{+6}$  from acidic solution by  $\text{CHCl}_3$  solutions of cupferron are given by Furman, Mason and Pekola, 1949.

### CI MOLYBDENUM CHLORIDE COMPLEXES

The distribution of Mo chloride complexes between 0-9 N HCl and butyl, iso-butyl, iso amyl alcohols, ethyl ether, butyl formate and other ethers was studied by Zharovskii, 1957.

Data for the extraction of  $\text{Mo}^{+6}$  between aq. HCl and ethyl ether in the presence of  $\text{K}_2\text{HPO}_4$ ,  $\text{H}_2\text{C}_2\text{O}_4$  and NaF are reported by Zharovskii, 1957a.

### F MOLYBDENUM FLUORIDE COMPLEXES

Data for the extraction of  $\text{Mo}^{+6}$  from 1-20 M HF solutions by ethyl ether at  $20^\circ$  are given by Bock and Herrmann, 1956. See also Kitahara, 1949.

### I MOLYBDENUM IODIDE $\text{MoI}_6$

For data on the extraction of  $\text{MoI}_6$  from 6.9 N HCl by ether, see Kitahara, 1948. ("6.5% extracted.")

MOLYBDENUM TRIOXIDE  $\text{MoO}_3$ 

0

SOLUBILITY IN WATER  
(Rosenheim and Davidsohn, 1903)

The dihydrate is stable below about  $33^\circ$ . Crystals of monohydrate separate from solutions of the dihydrate that are held at  $40$ – $50^\circ$ . The dihydrate has sometimes been referred to as the acid, and the monohydrate as

## Mo MOLYBDENUM

SOLUBILITY OF MOLYBDIC OXIDE IN HYDROCHLORIC ACID SOLUTIONS  
(Issa and Khalifa, 1954)In  $10^{-6}$  N to 1 N HCl solutions:

pH		Gms. MoO <sub>3</sub> per liter sat. sol.	pH		Gms. MoO <sub>3</sub> per liter sat. sol.
before saturation	after saturation		before saturation	after saturation	
0.218	0.265	4.420	2.69	2.46	0.660
0.631	0.670	1.680	2.84	2.51	1.18
1.07	1.10	0.412	3.09	2.66	1.416
1.12	1.16	0.35	3.96	2.80	1.856
1.42	1.39	0.320	4.73	2.38	1.712
1.53	1.48	0.316	5.82	2.46	1.640
1.72	1.69	0.312*	6.40	2.11	1.630
2.09	2.03	0.328			

In 2 N to 6 N HCl solutions:

In more concentrated acid, longer times were needed for equilibration:

N HCl:	2	3	4	5	6
Gms. MoO <sub>3</sub> per liter	68.08	49.4	29.62	18.1	9.84

\*Minimum solubility (isoelectric point) = pH 1.7. Basko and Nabivanets, 1957 report the isoelectric pH to be 1.8, and the solubility 0.093 gms. per liter by solubility method and 1.46 gms. per liter by a method of "precipitation of the hydrated oxide." Neither value agrees with the value of Issa and Khalifa, above.

Results for the distribution of Mo<sup>+6</sup> between a large number of aqueous and organic phases are given by Nelidow and Diamond, 1955. 2-12 M HCl, HBr, H<sub>2</sub>SO<sub>4</sub>, HNO<sub>3</sub>, etc. and 10<sup>-2</sup> to 10<sup>-9</sup> M Mo<sup>+6</sup> were present in the aqueous phase, and 32 organic solvents were used as extractants.

SOLUBILITY OF MOLYBDIC OXIDE IN POTASSIUM FLUORIDE SOLUTIONS AT 95°

NITROGEN N<sub>2</sub>

## SOLUBILITY IN WATER

(Winkler, 1891; Bohr and Bock, 1891; Morrison and Billett, 1952)

Results in reasonable agreement with these are given by Braun, 1900; Hufner, 1906-07; Bohr, 1910; Müller, 1912-13; von Hamel, 1915; Cassuto, 1904; Orcutt and Seever, 1936, 1937; Van Slyke, 1939.

Of the several determinations, Winkler's are generally lowest; above 35° the recent values of Morrison and Billett are considerably higher than the older work.

$\beta$  = Bunsen absorption coefficient = ml N<sub>2</sub> (at 0°, 760 mm.) dissolved by 1 ml. H<sub>2</sub>O when partial pressure N<sub>2</sub> = 760 mm.

$\beta'$  = "Solubility" = ml N<sub>2</sub> (at 0°, 760 mm) dissolved by 1 ml. H<sub>2</sub>O when total pressure (N<sub>2</sub> + H<sub>2</sub>O) = 760 mm.

q = gms. N<sub>2</sub> per 100 gms. H<sub>2</sub>O when total pressure = 760 mm.

## SOLUBILITY OF NITROGEN IN WATER AT HIGH TEMPERATURES AND PRESSURES

The results in the table are by Wiebe, Gaddy and Heins, Jr., 1932, 1933 unless otherwise indicated. The apparatus consisted of two steel cylinders respectively of 1000 cc and 300 cc capacity. They were filled with water to three fourths capacity and N<sub>2</sub> bubbled through at the desired temperature and pressure. Equilibrium was approached from pressures above and below that for the particular determination, and gas bubbled through at the final pressure for three hours and the saturated solutions allowed to stand 2-14 hours before samples were removed for analysis. The nitrogen was 99.9% pure, the impurities being argon and a trace of oxygen.

Data in excellent agreement with these are given by Saddington and Krase, 1934 in the table following. When compared with the findings of W. G. and H. and S. and K.: The values of Frolich, Tauch, Hogan and Peer, 1931 are within  $\pm 8\%$  at 25°, while those of Goodman and Krase are up to 20% high at high temperatures and pressures. Additional data are given by Eichelberger, 1955.

## SOLUBILITY OF NITROGEN IN WATER AT 50° TO 240° AND AT PRESSURES FROM 100 TO 300 ATMOSPHERES (Saddington and Krase, 1934)

It is pointed out that a quantitative solution of the problem requires density measurements of both the liquid and vapor phase in these systems at high temperatures and pressures, as well as a knowledge of the compressibility coefficient of the liquid. The highly perfected apparatus permitted saturation of the water with N<sub>2</sub> at the desired temperatures and pressures and subsequent removal of samples of the liquid and gas phases for analysis.

The data are in excellent agreement with those of Wiebe, Gaddy and Heins, Jr. in the preceding table. Calculated results for the compressibility factors of the gas phase are also given.

Liquid Phase		Gas Phase			
t°	cc N <sub>2</sub> (reduced to 0° and 760 mm) to saturate 1.0 gm. H <sub>2</sub> O	t°	Gm. H <sub>2</sub> O per liter gas phase	Gm. per 1.0 gm. Gas Phase	Density of Gas Phase gms. per liter

## N NITROGEN

### SOLUBILITY OF NITROGEN IN SALT SOLUTIONS (Morrison and Billet, 1952)

Values of "salting-out" constants  $k = \frac{\log S_0/S}{C}$

$S_0$  = Solubility in pure  $H_2O$  ( $\beta$ )

$C$  = Moles salt per 1000 gms.  $H_2O$ .

t°	S <sub>0</sub>	k		
		NaCl	LiCl	KI
12.6	0.01837	0.145	0.125	0.134
30	0.01377	0.121	0.095	0.100
50	0.01125	0.106	0.084	0.086
72	0.1054	0.106	0.092	0.084

### SOLUBILITY OF NITROGEN IN SEA WATER (Fox, 1909a)

Before using the sample of sea water for the solubility determinations it was found necessary to add acid, otherwise the  $CO_2$  could not be boiled out or the precipitation of neutral carbonates prevented. The very small amount of acid was titrated back, using phenolphthaleine as indicator.

The results are in terms of number of cc. of nitrogen (containing argon) absorbed by 1000 cc. of sea water from a free dry atmosphere of 760 mm. pressure.

The calculated formula expressing the solubility is:

$$1000a = 18.639 - 0.4304t + 0.007453t^2 - 0.0000549t^3 \\ - CI(0.2172 - 0.007187t + 0.0000952t^2).$$

Parts Chlorine per 1000	t°=0°	4°	8°	12°	16°	20°	24°	28°
0	18.64	17.02	15.63	14.45	13.45	12.59	11.86	11.25

12	16.03	14.75	13.66	12.72	11.93	11.25	10.67	10.16
16	15.18	14	13	12.15	11.73	10.81	10.27	9.80
20	14.31	13.27	12.34	11.57	10.92	10.36	9.87	9.44

A critical examination of the available data upon the Solubility of Nitrogen in pure water and in sea water has been made by Coste, 1917, 1927. It is concluded that "When proper allowances have been made for the effect of argon in the solubility of atmospheric nitrogen, considerable uncertainty exists as to the absorption coefficients of both this mixed gas and pure nitrogen in distilled Water. A similar uncertainty exists in the case of sea water.

SOLUBILITY OF NITROGEN IN WATER AND IN WHOLE BLOOD AT 38°  
(Hawkins and Shilling, 1938)

Calves and dogs blood oxalated to 0.02% was either used immediately or after being kept at 0° until next day. The Van Slyke and Neill (1920) manometric apparatus was used and the determinations made upon 5cc samples.

9 samples of blood were used varying in  $O_2$  capacity from 15.70 to 20.14 Vol. percent. These results are for the sample having 20.14  $O_2$  capacity. The abs. coef. varied from 0.0138 to 0.0148 for dogs' blood and 0.0135 to 0.0140 for ox blood.

$\alpha$  = the Bunsen Absorption Coefficient = the cc of  $N_2$  (reduced to 0° and 760 mm) which are dissolved by 1cc of the saturated solution at a pressure of 760mm Hg.

Conant and Scott, 1926.

Data for the solubility of nitrogen in defibrinated ox-blood and ox  
serum under pressures varying 760-1400 mm. Hg are given by Findlay and  
Creighton (1910-11).

Data for the solubility of nitrogen in liquid oxygen are given by  
Erdman and Bedford (1904) and Stock (1904).

The Solubility of Nitrogen in Water and in aqueous suspensions of blood lipoids was determined by Grollman, 1929, with results showing that the lipoids increase the solubility of the nitrogen.

Determinations of the Solubility of Nitrogen in Azobacter Cells are given by Lineweaver, 1938.

Data for the absorption of nitrogen in solutions of organic dyes are given by Weigert, 1910.

## NITROGEN

### SOLUBILITY OF NITROGEN IN RUBBER (Carpenter, 1947)

Composition of sample, parts by weight: Smoked Sheet Rubber 100, Sulfur 2.5, ZnO 3.0, Stearic Acid 1.0, Mercapto Benzthiazole 0.5, Agrite White 0.5. A vulcanized cylindrical piece was used and the adsorption was carried out in the dark. Diffusion rates were also measured. The results differed by as much as 10% depending on the method of calculating.

t°	Gms. N <sub>2</sub> per cc Rubber per Atm.	cc N <sub>2</sub> (0°, 760mm) per 100 cc Rubber per Atm.	t°	Gms. N <sub>2</sub> per cc Rubber per Atm.	cc N <sub>2</sub> (0°, 760mm) per 100 cc Rubber per Atm.

<sup>b</sup>Barrer, 1941

### SOLUBILITY OF NITROGEN IN LIQUID METHANE AND PROPANE AT -183° (Vellinger and Pons, 1945)

The apparatus was immersed in liquid oxygen. The data were read from curves given by the authors:

Total Pressure mm	cc N <sub>2</sub> Dissolved in 100 cc of		Total Pressure mm	cc N <sub>2</sub> Dissolved in 100 cc of	
	Methane	Propane		Methane	Propane
150	1.2	0.7	500	7.9	1.7
250	2.5	1.0	650	14.3	2.4
350	4.1	1.3	750	26	

The solid-liquid equilibria of the systems nitrogen-methane and nitrogen-argon were studied by Federova (1939) from heat capacity curves.

Liquid-Vapor equilibrium data for the system nitrogen-benzene at high pressures is given by Miller and Dodge, 1940.

The solubility of nitrogen in ethylene at 0° and pressures up to 7000 Kg./cm.<sup>2</sup> has been determined by Tsiklis, 1947a.

Results for the solubility of nitrogen in liquid hydrogen at 20°-32° K are given by Petit, 1957.

# SOLUBILITY OF NITROGEN IN LIQUID SULFUR DIOXIDE (Dean and Walls, 1947)

The results disagree with those of Donte and Ferguson, 1939, which showed a considerably greater solubility. The authors point out that the relatively large vapor-volume corrections made by the previous workers may have introduced large errors.

t °F	Pressure Lbs. per sq. In. Absolute	cc. N <sub>2</sub> (32°F, 1 Atm.) per gm. SO <sub>2</sub>	t °F	Pressure Lbs. per sq. In. Absolute	cc. N <sub>2</sub> (32°F, 1 Atm.) per gm. SO <sub>2</sub>

-4.0	253	1.9	-25.7		0.06

1 Atm. Partial Pressure of Nitrogen.

Data for the system N<sub>2</sub>-SO<sub>2</sub> from 25° to 40° at pressures up to 9000 Kg/cm<sup>2</sup> are given by Tsiklis, 1947.

# SOLUBILITY OF NITROGEN IN LIQUID AMMONIA AT 25° AND FROM 25 TO 1000 ATMOSPHERES PRESSURE (Wiebe and Tremearne, 1934)

Liquid ammonia and Nitrogen were shaken together at given pressures in a steel cylinder of 1400cc. capacity. The sample removed for analysis was received in a vessel immersed in liquid air, and subsequently analyzed by appropriate methods. The vapor pressure of liquid ammonia at 25° is 9.8955 atmospheres.

Total Pressure in Atmospheres	cc N <sub>2</sub> (at 0° and 760mm) dissolved per 1.0 gm. NH <sub>3</sub>	Total Pressure in Atmospheres	cc N <sub>2</sub> (at 0° and 760mm) dissolved per 1.0 gm. NH <sub>3</sub>
25	2.22	400	37.02
50	5.73	600	45.43
100	12.04	800	51.10
200	22.48	1000	54.83

Results for the system Nitrogen + Hydrogen + Ammonia (Gas) + Ammonia (Liquid) at temperatures from -22.5 to +18.7° and pressures from 50 to 1000 atmospheres are given by Larson and Black, 1925. A discussion of these and similar results for other systems, in the concept that solubility effect is a change in activity of one component resulting from the presence of the other component, is given by Cupples, 1929. More recent results from 0° to 50° up to 800° atm are given by Bol'shakov, 1954.

A nomograph for the solubility of nitrogen in liquid ammonia is given by Davis, 1941.

The solubility of nitrogen-methane mixtures in liquid ammonia from -20° to 50° up to 560 atm. has been determined by Bolshakov and Lebedeva, 1940.

Liquid-Vapor and Vapor-Vapor equilibrium data in the system N<sub>2</sub>-NH<sub>3</sub> up to 9000 atm and 148° are reported by Tsiklis, 1952, 1952a. Other data below 110° are given by Lindroos and Dodge, 1952. Two phases are formed below 85°.

## N NITROGEN

For data in the two-phase system  $N_2$ - $NH_3$ - $CH_4$  at  $85^\circ$ ,  $105^\circ$  up to 5000 Kg/cm<sup>2</sup> see Tsiklis, 1951.

### SOLUBILITY OF NITROGEN IN METALS

Results for Cobalt	(Sieverts and Hagen, 1934.)
" " Iron	(Jurisch, 1912; Martin, 1929; Sieverts, 1931; 1938; Eisenhutu and Kaupp (1930); Hayasi (1940), and Krichevskii and Khazanova (1947). (Martin, 1929.)

" " Tungsten	(Martin, 1929.)

## H AMMONIA $NH_3$

### THE SYSTEM $NH_3$ - $H_2O$ (Postma, 1920; Elliott, 1924)

The closely agreeing determinations of these investigators were plotted on cross-section paper and the following results read from the curve.

Considerable additional data on this system are given by Rupert, 1910; Smits and Postma, 1914; Baumé and Tykociner, 1914; and Moronov, 1955; see the table following. Rollet and Vuillard, 1956 and Vuillard, 1957, report the presence of a dihydrate that is stable within one degree of the eutectic.

t°	Mole percent $NH_3$	Gms. $NH_3$ per 100 gms. solution	Solid Phase

<sup>m</sup>metastableEQUILIBRIUM IN THE SYSTEM AMMONIA AND WATER AT  
TEMPERATURES UP TO 150° AND PRESSURES UP TO 10 ATMOSPHERES  
(Clifford and Hunter, 1933)

A dynamic method was used to determine the vapor compositions between 60° and 100° and for pressures up to 1.5 atmospheres. At higher ranges of temperature and pressure a static method was used. Total vapor pressures and vapor compositions were measured. The results were plotted together with those of Perman 1903, Mollier, 1908 and Smits and Postma, 1914 and from the curves so obtained, tables for the isobars and isotherms were constructed. The following are the values for the isobars.

SOLUBILITIES AND PARTIAL PRESSURES OF AMMONIA IN WATER  
(Neuhausen and Patrick, 1921)

The determinations were made by repeatedly introducing ammonia into a receptacle containing a given volume of water, until no further diminution in pressure occurred after thorough shaking. By means of a special device a portion of the saturated solution was withdrawn without a material change in pressure, and thus without alteration in the content of ammonia. Successive samples were titrated and the following results were calculated from these titrations and the pressure readings.

t°	Mole fraction percent ammonia	Partial pressure in mm. of		Density of Solution	Percent contraction in volume

## VAPOR PRESSURE OF AQUEOUS AMMONIA SOLUTIONS (Sherwood, 1925)

This author collected the available data on the partial vapor pressure of ammonia in water and plotted the results on logarithmic paper to reduce the curvature and obtain constant percentage errors. The results of Raoult, Carius, Perman, Watts, Sims, Roscoe and Ditmar, Cragoe, Myers and Taylor, Mallet, Mollier, Smits and Postma, Doryer and Gaus were used.

Additional data for the vapor pressure of aqueous solutions of ammonia at 0° are given by Klarmann, 1924; at 25° by Scheffer and de Wijs, 1925; and Breitenbach, 1925; and at 100° by Calingaert and Huggins, 1923. Other determinations of conductivities and vapor pressures at 0°, 10°, 18°, 25° were made by Morgan and Maas, 1931.

THE SYSTEM AMMONIA - HYDROGEN PEROXIDE  
(Maass and Matcher, 1922)

By means of a gas buret definite volumes of ammonia were added to weighed quantities of pure hydrogen peroxide, and the freezing-points of the resulting mixtures were accurately determined.

SOLUBILITY OF AMMONIA IN AQUEOUS SALT SOLUTIONS AT 25°  
(Abegg and Riesenfeld, 1902)

The determinations were made by the dynamic method. In a later paper by Riesenfeld (1903), additional determinations are given for 35°.

\*These salt solutions are 0.25 normal.

Konowalow (1898) expressed the results of determinations of the solubility of ammonia in aqueous silver nitrate by the equation  $H = 56.58 (m - 2n)$  in which  $H$  = partial pressure of NH<sub>3</sub> in mm. of Hg.,  $m$  = molecular concentrations of NH<sub>3</sub> and  $n$  = molecular concentration of AgNO<sub>3</sub>. Similar results are given in later papers (Konowalow, 1899, a, b) for a large number of other salt solutions.

Data for the solubility of ammonia in aqueous sodium hydroxide solutions at 15° are given by Miloslawski, 1931.

## SOLUBILITY OF AMMONIA IN Ca(NO<sub>3</sub>)<sub>2</sub> and KOH SOLUTIONS (Raoult)

t°	In Calcium Nitrate Solutions		In Potassium Hydroxide Solutions	
	Gms. NH <sub>3</sub> per 100 Gms. Solvent in:		Gms. NH <sub>3</sub> per 100 Gms. Solvent in:	
	28.38% Ca(NO <sub>3</sub> ) <sub>2</sub>	In 50.03% Ca(NO <sub>3</sub> ) <sub>2</sub>	11.25% KOH	25.25% KOH

24	-	-	37.3	21.8

THE SYSTEM POTASSIUM CARBONATE - AMMONIA - WATER  
(Newth, 1900)

The solutions used were: potassium carbonate saturated at 15° (contained 57.2 grams  $K_2CO_3$  per 100 cc.). Aqueous ammonia of 0.885 sp. gr. (contained about 33 percent ammonia). The determinations were made by adding successive small quantities of one of the solutions to a measured volume of the other, and observing the point at which opalescence appeared.

t°	Saturated $K_2CO_3$ in Aq. Ammonia		Aq. Ammonia in Saturated $K_2CO_3$	
	cc. $K_2CO_3$ per 100 cc. Ammonia	% $K_2CO_3$ Solution in Mixture	cc. Ammonia in 100 cc. $K_2CO_3$	% $K_2CO_3$ Solution in Mixture
1	2.0	2.0	37.5	72.7
6	3.0	3.0	47.5	67.6
11	5.0	4.7	52.5	65.0
16	6.5	6.1	60.0	63.0
21	8.5	8.0	77.5	56.3
26	10.5	9.5	105.0	49.0
31	12.5	11.1	152.5	39.0
38	20.0	16.6	195.0	33.0
39	21.0	17.0	220.0	31.0
42	25.0	20.0	250.0	28.5
43	35.0	26.0	285.0	26.5

Above 43° the solutions are completely miscible. If 10 percent of water is added to each solution the temperature of complete miscibility is lowered to 25°. The mutual solubilities are:

t°	Percent $K_2CO_3$ Solution in:	
	Ammonia Layer	$K_2CO_3$ Sol. Layer
0	8	62
10	11	52
20	15	38
25 (crit. pt.)		25

With the addition of 12.9 percent of water to each solution the temperature of complete miscibility (crit. pt.) is lowered to 10°. With the addition of 18.1 percent water this temperature becomes 0°.

INFLUENCE OF SALTS AND OTHER COMPOUNDS ON THE VAPOR PRESSURE OF  
AQUEOUS AMMONIA SOLUTIONS  
(Perman, 1902)

Vapor pressure determinations were made as above described on aqueous solutions of the following compositions -- (a) 10.43% Urea + 16.36%  $NH_3$ , (b) 5.29% Urea + 17.22%  $NH_3$ , (c) 4.56% Mannitol + 12.27%  $NH_3$ , (d) 3.05%  $K_2SO_4$  + 7.49%  $NH_3$ , (e) 5.27%  $NH_4Cl$  + 16.85%  $NH_3$ , (f) 10.26%  $NH_4Cl$  + 12.9%  $NH_3$ , (g) 2.68%  $CuSO_4$  + 14.65%  $NH_3$ , (h) 3.94%  $CuSO_4$  + 6.54%  $NH_3$ .

The author's data were plotted on cross section paper and the following values read from the curves.

(Cont.)

# N NITROGEN

## INFLUENCE OF SALTS AND OTHER COMPOUNDS ON THE VAPOR PRESSURE OF AQUEOUS AMMONIA SOLUTIONS--Cont.

t°	Vapor Pressure of Each Solution in mm. of Mercury							
	(a)	(b)	(c)	(d)	(e)	(f)	(g)	(h)

60	1050	1060	705	453	975	770	-	344

In an earlier paper Perman (1901) gives data similar to the above for the vapor pressure of ammonia in aqueous solutions of sodium sulfate.

Gaus (1900) gives data for the vapor pressure of ammonia in aqueous 0.4 n. solutions of about 20 salts.

SOLUBILITY OF AMMONIA IN CHLOROFORM AT 25°  
(Seward, 1932)

A series of solutions of varying concentrations were prepared from CHCl<sub>3</sub> which had been saturated with NH<sub>3</sub>, by successive dilutions with CHCl<sub>3</sub>. These were each shaken in a closed vessel and after attainment of equilibrium, the NH<sub>3</sub> in both the liquid and vapor phase was determined by titration. The CHCl<sub>3</sub> contained 0.1 percent C<sub>2</sub>H<sub>5</sub>OH. The exact content of C<sub>2</sub>H<sub>5</sub>OH is important since the solubility of NH<sub>3</sub> increases with the proportion of C<sub>2</sub>H<sub>5</sub>OH. The presence of 1.0 percent C<sub>2</sub>H<sub>5</sub>OH was found to increase the solubility of NH<sub>3</sub> in CHCl<sub>3</sub> about 20 percent.

0.392	0.00749	139.2			

\*The partial pressures of NH<sub>3</sub> were calculated from the concentration of the NH<sub>3</sub> in the vapor phase, assuming Dalton's law to hold and neglecting the deviations of ammonia gas from the perfect gas law. The d. of the CHCl<sub>3</sub> was 1.480 at 25° and that of the solution containing 1.315 gm. mols. NH<sub>3</sub> per liter was 1.450. These figures were used in calculating the concentrations of NH<sub>3</sub> to volume of liquid phase.

## DISTRIBUTION OF AMMONIA BETWEEN WATER AND CHLOROFORM

$$\frac{(a)}{(c)} = 35.83$$

Additional data for the distribution of ammonia between water and chloroform are given by Hantsch and Sebaldt (1899), Dawson and McCrae (1900), (1901a), (1901b); Dawson (1906), (1909); Abbott and Bray (1907); Sherrill and Russ (1907); Bell (1911), and by Moore and Winmill (1912). The results show that with increase of concentration of ammonia, the relative amount in the aqueous layer diminishes. Thus Bell found that at 25° the distribution ratio is 22.7 when the aqueous layer contains 1.02 gm. mols.  $\text{NH}_3$  per liter and only 10 when 12.23 gm. mols.  $\text{NH}_3$  are present in the aqueous layer. The influence of increase of temperature was also found to be in the direction of diminution of the relative amount in the aqueous layer.

The influence of the presence of a large number of salts in the aqueous layer has been studied by several of the above-mentioned investigators. In the case of copper, zinc and cadmium salts (Dawson and McCrae, 1900), (Dawson, 1909), the distribution ratio varied with salt concentration in a manner indicating that metal ammonia compounds were formed.

Results for the effect of  $\text{KOH}$ ,  $\text{NaOH}$  and  $\text{Ba(OH)}_2$  on the distribution at 18° are given by Dawson (1909).

Results for the effect of ammonium chromate upon the distribution at 25° are given by Sherrill and Russ (1907).

Results for the distribution of ammonia between water and mixtures of chloroform and amyl alcohol at 25° are given by Herz and Kurzer (1910).

Data for the distribution of ammonia between chloroform and aqueous solutions containing various concentrations of both ammonium chloride and magnesium chloride at 18° are given by Fredholm, 1934.

#### DISTRIBUTION OF AMMONIA BETWEEN CARBON TETRACHLORIDE AND AIR AT 15° (Roederer, 1936)

The experiments were made by shaking  $\text{CCl}_4$  containing  $\text{NH}_3$  with air or by shaking  $\text{CCl}_4$  with air containing  $\text{NH}_3$ .

Gm. Mols. $\text{NH}_3$ per liter:		$\frac{(c)}{(a)}$	Gm. Mols. $\text{NH}_3$ per liter:		$\frac{(c)}{(a)}$

One liter of  $\text{CCl}_4$  saturated with ammonia at 15° and under 760 mm. partial pressure contains 0.306 gm. mols.  $\text{NH}_3$ .

## N NITROGEN

### SOLUBILITY OF AMMONIA IN SEVERAL SOLVENTS AT 20° AND 760MM. PRESSURE (Bell, 1931)

The solvents were saturated with  $\text{NH}_3$  and the amount of gas present in a known amount of the saturated solution determined by removing it with a current of air, absorbing in an excess of  $\text{HCl}$  and titrating.

$s$  = the partition coefficient of  $\text{NH}_3$  between the liquid and the vapor, that is,  $s = c$  (the gm. equiv.  $\text{NH}_3$  per liter)  $\div$  0.0417 and  $s/c = 22.4 \times 293/273$ .

$x$  = the mol. fraction (gm. mol.  $\text{NH}_3$  per 1.0 gm. mol.  $\text{NH}_3$  + solvent) calculated on the assumption that the densities of the solutions obey the ideal mixture law.

### DISTRIBUTION OF AMMONIA BETWEEN TOLUENE AND AIR (Hantzsch and Vagt, 1901)

t°	Gms. $\text{NH}_3$ per 1000 cc.		Mols. $\text{NH}_3$ per 1000 cc.	
	$\text{C}_6\text{H}_5\text{CH}_3$ Layer	Air	$\text{C}_6\text{H}_5\text{CH}_3$ Layer	Air
0	0.366	0.0396	0.0215	0.00233
10	0.357	0.0435	0.0210	0.00256
20	0.326	0.0451	0.0192	0.00265
30	0.286	0.0462	0.0168	0.00272

Data for the distribution of ammonia between toluene and aqueous silver ammonium chloride and hydroxide at 25° are given by Randall and Halford, 1930.

One liter of Cyclohexanol ( $\text{C}_6\text{H}_{11}\text{OH}$ ) dissolve 28,166.7 cc. ammonia ( $\text{NH}_3$ ) at 26° and 755 mm. pressure. (Cauquil, 1927.)

### SOLUBILITY OF AMMONIA IN ETHYL ETHER (Christoff, 1912)

Results in terms of the Ostwald Solubility Expression at 0° = 17.13, at 10° = 12.35, at 15° = 10.27.

Data for the reciprocal solubility of gaseous ammonia and the vapors of methyl alcohol, acetone, ether and chloroform, determined by measuring at 25° the changes in pressure produced by adding a weighed amount of the volatile compound to a given volume of ammonia gas, are given by MacFarlane and Wright, 1934.

100 gms. of sat. solution of  $\text{NH}_3$  in hydroxylamine contain 26 gms.  $\text{NH}_3$  at  $0^\circ$  and 19-20 gms. at  $15^\circ$ - $16^\circ$ . (de Bruyn, 1892.)

The solubility of ammonia in nitrobenzene, in terms of the Bunsen Absorption Coefficient, is 18.37 at  $15^\circ$ , 12.61 at  $25^\circ$  and 8.257 at  $40^\circ$  (Baars, 1927).

At  $25^\circ$ , 31 vols. ( $0^\circ$ , 760 mm.) of  $\text{NH}_3$  dissolve in 1 vol. of dimethylformamide (DuPont, 1955).

100 cc. of rubber saturated with ammonia at  $21^\circ$  dissolve 930 cc.  $\text{NH}_3$  ( $0^\circ$  and 760 mm.). The determination was made by pumping out the gas with a Töpler pump and measuring it over mercury. Results for the effect of pressure and temperature upon the solubility are also given (Veneble and Fuwa, 1922). H

Limited gas solubilities in the system ammonia-argon are reported by Tsiklis and Vasil'ev, 1955.

NOTE: For phase equilibria involving liquid ammonia + organic compounds, see "ORGANIC" solubilities volume.

AB·4 =  $(\text{NH}_4)_2\text{B}_4\text{O}_7 \cdot 4\text{H}_2\text{O}$ ; SB·10 =  $\text{Na}_2\text{B}_4\text{O}_7 \cdot 10\text{H}_2\text{O}$ ; SB·5 =  $\text{Na}_2\text{B}_4\text{O}_7 \cdot 5\text{H}_2\text{O}$ .

The cryohydric temperature of the system  $(\text{NH}_4)_2\text{B}_4\text{O}_7 + \text{Na}_2\text{B}_4\text{O}_7 + \text{Ice}$  is  $-1.22^\circ$  and 100 gms. of the saturated solution contain 3.472 gms. of  $(\text{NH}_4)_2\text{B}_4\text{O}_7$  and 0.6447 gm. of  $\text{Na}_2\text{B}_4\text{O}_7$ . (Sborgi and Gallichi, 1924.)

THE SYSTEM  $(\text{NH}_4)_2\text{B}_4\text{O}_7 + \text{Na}_2\text{SO}_4 = \text{Na}_2\text{B}_4\text{O}_7 + (\text{NH}_4)_2\text{SO}_4$   
(Sborgi, Bovalini and Medici, 1924; Sborgi, 1924)

The authors also give results for the solubility of the individual salts in water at these temperatures, and for mixtures of ammonium and sodium sulfates with the double salt  $(\text{NH}_4)\text{NaSO}_4$ . Determinations of the transformation temperatures in this system are given by Sborgi and Stefanini, 1924.

Results for aqueous solutions saturated with respect to:

## CN AMMONIUM LEAD COBALTICYANIDE $\text{NH}_4\text{PbCo}(\text{CN})_6 \cdot 3\text{H}_2\text{O}$

100 grams.  $\text{H}_2\text{O}$  dissolve 12 grams of the salt at 18°. (Schuler, 1879.)

## SCN AMMONIUM THIOCYANATE $\text{NH}_4\text{SCN}$

SOLUBILITY IN WATER  
(Shnidman, 1934; Foote, 1921)

Earlier data, averaging somewhat higher than these are given by Rüdorff, 1868 and 1872; Wassilijew, 1910; Smits and Kettner, 1912. The eutectic occurs at about -25°, 42%  $\text{NH}_4\text{SCN}$ . Other freezing-point data for mixtures of ammonium thiocyanate and water are given by Vasiliev, 1917.

THE SYSTEM AMMONIUM THIOCYANATE - PHENOL - WATER  
(Merclin, 1940)

The system was studied at 20°, 30°, 40°, and 50° and contains an immiscibility gap between the solutions of ammonium thiocyanate rich in water and those rich in phenol. The two liquids become more miscible as the temperature is increased, and at 50° there is only one liquid phase in the system. The separate smaller miscibility gaps remain, instead of the one large gap at lower temperatures. The author gives data for the composition of solutions which are in equilibrium with a second liquid layer, but does not indicate which phases are coexistent. The maximum solubility of  $\text{NH}_4\text{SCN}$  in each layer is given below. These are the compositions of the liquid phases which are in equilibrium with each other, and with excess solid  $\text{NH}_4\text{SCN}$ .

Data for the system ammonium thiocyanate, ethyl ether and water at 20° are given by Nesterow and Petine, 1932. See also Bock, 1951.

Data for the system ammonium thiocyanate, thiourea and water at 25° are given by Smits and Kettner (1912) in the form of a triangular diagram, but the numerical results are omitted. The diagram confirms the freezing-point lowering results in showing that the molecular compound  $\text{NH}_4\text{SCN} \cdot 4(\text{NH}_4)_2\text{CS}$  is formed.

HCO AMMONIUM BICARBONATE  $\text{NH}_4\text{HCO}_3$

### THE SYSTEM AMMONIA - CARBON DIOXIDE - WATER (Janecke, 1929a)

The synthetic sealed tube method was used for determination of the temperatures of complete solution or appearance of immiscible layers in all possible mixtures of the three components. The mixtures were prepared from weighed amounts of either ammonium bicarbonate or carbamate and aqueous ammonia solutions of given concentrations. In those mixtures containing a large excess of ammonia, liquid  $\text{NH}_3$  was distilled at very low temperature into the tubes containing the salt and water. On account of the danger of explosion in these cases the tubes were incased in a metal cylinder and observed by light transmitted through protected windows. For observation of the point of complete solution at low temperatures the tubes were first cooled in a mixture of liquid  $\text{CO}_2$  and acetone until a solid phase separated and then allowed to warm to the temperature at which this solid phase just disappeared. More than 300 such observations were made and from the diagram plotted from them the values for isotherms and the invariant points were obtained. The solid phases were identified analytically and microscopically.

The previous results of Terres and Weiser, 1921, and Terres and Behrens, 1928, are shown to be in error due to imperfections in the method employed, except at temperatures below  $60^\circ$  and when the solid phase is bicarbonate or sesquicarbonate. The two solid phases reported by Terres in addition to the four here mentioned are shown not to exist.

In the following table (1) designates ammonium bicarbonate,  $\text{NH}_4\text{HCO}_3$ , (2) ammonium carbonate,  $(\text{NH}_4)_2\text{CO}_3 \cdot \text{H}_2\text{O}$ , (3) ammonium carbamate  $\text{NH}_4\text{COONH}_2$  and 1.2 ammonium sesquicarbonate  $(\text{NH}_4)_2\text{CO}_3 \cdot 2\text{NH}_4\text{HCO}_3$ .

AMMONIUM BICARBONATE  $\text{NH}_4\text{HCO}_3$ SOLUBILITY OF AMMONIUM BICARBONATE IN WATER  
(Janecke, 1929)

The usual method of solubility determination could not be employed since the vapor with which the solutions are in equilibrium is not that of  $\text{H}_2\text{O}$  alone or of  $\text{CO}_2$  and  $\text{NH}_3$  in the molecular ratio of ammonium bicarbonate but contains relatively more  $\text{CO}_2$ . The solution therefore contains more  $\text{NH}_3$  than corresponds to  $\text{NH}_4\text{HCO}_3$ . The synthetic sealed tube method was used and the temperatures determined at which complete solution occurred in known mixtures of  $\text{NH}_4\text{HCO}_3$  and  $\text{H}_2\text{O}$ . At temperatures above  $60^\circ$  very small tubes were used and in order to avoid danger of explosion these were placed in an electrically heated metal block with a hole, protected by glass plates, through which the tube could be observed by transmitted light. The determinations were plotted and the following values taken from the curve. They agree with previous determinations except at the higher temperatures.

(The results in parentheses are the averages of the previous determinations of Fedotieff, 1904; Nishizawa, 1920; Toparescu, 1922; and Fedotieff and Kolossoff, 1923.)

At 15° a solution saturated with  $\text{NH}_4\text{HCO}_3 + \text{NH}_4\text{Cl}$  contains 7.02 gms.  $\text{NH}_4\text{HCO}_3$  and 35.4 gms.  $\text{NH}_4\text{Cl}$  per 100 gms.  $\text{H}_2\text{O}$ . (Fedotieff and Kolossof, 1923.)

### THE SYSTEM $\text{NH}_4\text{HCO}_3 + \text{NaCl} \rightleftharpoons \text{NH}_4\text{Cl} + \text{NaHCO}_3$ (Neumann and Domke, 1928)

The authors mention that few previous studies of the equilibrium in the ammonia-soda process have been made under conditions resembling closely those of the actual manufacturing process. This consists in saturating natural or artificial sodium chloride brine with ammonia and treating this with 30-40 vol. percent  $\text{CO}_2$  under pressure. The authors have therefore made determinations at 20° to 40° and under 1.2 and 2.5 atmospheres pressure of  $\text{CO}_2$  with results which permit the calculation of the yield of sodium and ammonium for each varying composition of the solution. Results for the binary systems involved may be found separately.

AMMONIUM CARBAMATE  $\text{NH}_4\text{CO}_2\text{NH}_2$ 

CON

## SOLUBILITY IN WATER

The equilibrium relations in the system  $\text{NH}_4\text{CO}_2\text{NH}_2 - \text{H}_2\text{O}$  were determined as part of the system  $\text{NH}_3 - \text{CO}_2 - \text{H}_2\text{O}$  by Jänecke, 1929a (see p. 638).  $\text{NH}_4\text{CO}_2\text{NH}_2$  is stable in contact with water only above 57°. Between 57° and 5° decomposition to the sesquicarbonate occurs, and from 5° to -13° (eutectic) to the carbonate. The diagram below is given by Jänecke.

The System Ammonium Carbamate - Water

### CO AMMONIUM OXALATE $(\text{NH}_4)_2\text{C}_2\text{O}_4$

#### SOLUBILITY OF AMMONIUM OXALATE IN WATER (Hill and Distler, 1935; above 100°; Benrath, 1942)

The solid phase is  $(\text{NH}_4)_2\text{C}_2\text{O}_4 \cdot \text{H}_2\text{O}$  in all cases. The results in parentheses are densities of the saturated solution determined by Flottmann, 1928. In addition to the above very careful determinations, results for the solubility of ammonium oxalate in water at temperatures up to 50° are also given by Engel, 1888; Foote and Andrew, 1905; Wandstra, 1912; Colani, 1916; Koenig, 1922 and Guigues, 1927.

## THE SYSTEM AMMONIUM CHLORIDE - AMMONIUM NITRATE - WATER--Cont.

Results of Janecke, 1928

The results are given in terms of the Janecke method of expressing such results, and the author found that the solid phases in contact with solutions containing the two salts, were composed of the salts and mixed crystals varying in content of  $\text{NH}_4\text{Cl}$  from 2 to 4 mols. per 100 mols.

THE SYSTEM AMMONIUM CHLORIDE - AMMONIUM DIHYDROGEN  
PHOSPHATE - WATER--Cont.

The eutectic temperature is  $-15.6^{\circ}$  and the solution contains 3.9%  $\text{NH}_4\text{H}_2\text{PO}_4$  and 17.8%  $\text{NH}_4\text{Cl}$ .

$\text{NH}_4\text{Cl} - \text{NH}_4\text{H}_2\text{PO}_4 - \text{H}_2\text{O}$  AT  $0^{\circ}$   
(Askenasy and Nessler, 1930)  
(see also table above)

d. of sat. sol.	Mol. % $\text{NH}_4\text{Cl}$ in dissolved salts	Mols. $\text{H}_2\text{O}$ to dissolve 100 mols. salt mixture	Solid Phase	Ck
1.0655	100.0	1000	$\text{NH}_4\text{Cl}$

Results of Kurnakov and Egorov, 1936

C1

Distributions in mixed crystals in the systems  $\text{NH}_4\text{Cl} - \text{CdCl}_2 - \text{H}_2\text{O}$  and  $\text{NH}_4\text{Cl} - \text{NiCl}_2 - \text{H}_2\text{O}$  are reported by Ioffe, 1956.

A study of the lower boundary of "true" vs. "anomalous mixed crystal formation in the systems  $\text{NH}_4\text{Cl} + \text{FeCl}_3$ , or  $\text{CrCl}_3$ ,  $\text{CuCl}_2$ ,  $\text{MnCl}_2$ ,  $\text{NiCl}_2$ ,  $\text{CoCl}_2$ ,  $\text{CdCl}_2 + \text{H}_2\text{O}$  is given by Ioffe, 1958. Data in the system  $\text{Ba}(\text{NO}_3)_2 + \text{methylene blue}$  are also reported.

THE SYSTEM AMMONIUM CHLORIDE - TERTIARY BUTYL ALCOHOL - WATER AT 30°  
(Ginnings and Robbins, 1930)

The points on the binodal curve of this system were determined by observing the appearance or disappearance of clouding in mixtures of weighed amounts of NH<sub>4</sub>Cl and one of the liquids, upon addition of a weighed amount of the other. Tie lines, \*, were located by determination of the NH<sub>4</sub>Cl in two liquid layers in contact with each other, and from these the plait point, PP, was found by plotting.

(Cont.)

# N NITROGEN

## THE SYSTEM AMMONIUM CHLORIDE - TERTIARY BUTYL ALCOHOL - WATER AT 30°--Cont.

In a later paper Ginnings, Herring and Webb, 1933, found the plait point of this system at 25° to be 37.6 gms. ter.  $(\text{CH}_3)_3\text{COH}$  + 6.6 gms  $\text{NH}_4\text{Cl}$  per 100 gms. sat. solution. The original results for the remaining points of the binodal curve are not given, but only values corresponding to derived empirical equations for the curve.

<sup>a</sup>Linhard and Stephan, 1933, 1934<sup>b</sup>Abe, Watanabe, and Hara, 1935<sup>c</sup>Hunt, 1932<sup>d</sup>Hurley and Sisler, 1957THE SYSTEM  $\text{NH}_4\text{Cl} - \text{NH}_4\text{NO}_3 - \text{NH}_3$  (liq.) AT 25°  
(Hunt and Boncyk, 1933)

One-fourth gram of the less soluble salt was mixed with variable amounts of the more soluble salt and ammonia added in excess. Ammonia was then allowed to escape until a single crystal of one salt came out of solution. Identical results were obtained by approaching the saturation point from opposite sides.

### SOLUBILITY OF AMMONIUM CHLORIDE IN LIQUID SULFUR DIOXIDE

0° - 0.009 gms.  $\text{NH}_4\text{Cl}$  per 100 gms.  $\text{SO}_2$  (Jander and Wickert, 1936; Jander and Ruppolt, 1937)

25° - 0.0031 gms.  $\text{NH}_4\text{Cl}$  per 100 gms.  $\text{SO}_2$  (Shatenstein and Viktorov, 1937)

Melting points are given for the following:

$\text{NH}_4\text{Cl} + \text{SbCl}_3$	(Kendall, Crittenden and Miller, 1923)
" $+\text{NH}_4\text{NO}_3$	(Perman, 1922)(Bergman, Radishchev, et al., 1947)
" $+\text{NH}_4\text{NO}_3 + \text{NaNO}_3$	(
" $+\text{NaCl} + \text{NaNO}_3$	"
" $+\text{NH}_4\text{NO}_3$	(Bowen, 1926)
" $+\text{CdCl}_2$	(Hackmeister, 1920)
" $+\text{CuCl}$	"
" $+\text{HgCl}$	(Janecke, 1923)
" $+\text{HgCl}_2$	"
" $+\text{AgCl}$	"
" $+\text{FeCl}_3$	(Hackmeister, 1920)
" $+\text{LiCl}$	"
" $+\text{ZnCl}_2$	"
" $+\text{NH}_4\text{H}_2\text{PO}_4$	(Bergman, Radishchev, et al., 1947)
" $+\text{NH}_4\text{H}_2\text{PO}_4 + \text{NH}_4\text{NO}_3$	"
" $+\text{NH}_4\text{Br}$	(Paris and Cochet-Muchy, 1952)(Mandleberg and Stavely, 1950)

### Cl DI, TETRA METHYL AMMONIUM CHLORIDES $\text{N}(\text{CH}_3)_2\text{H}_2\text{Cl}$ , $\text{N}(\text{CH}_3)_4\text{Cl}$ TETRA ETHYL AMMONIUM CHLORIDE $\text{N}(\text{C}_2\text{H}_5)_4\text{Cl}$

#### DIMETHYL AMMONIUM CHLORIDE (Hantzsch, 1902)

100 gms.  $\text{H}_2\text{O}$  dissolve 208 gms. of the salt.

100 gms.  $\text{CHCl}_3$  dissolve 26.9 gms. of the salt (temp. not stated in abstract).

#### TETRAMETHYL AMMONIUM CHLORIDE (Walden, 1906)

100 cc. sat. solution in  $\text{CH}_3\text{CN}$  contain 0.265 gms.  $\text{N}(\text{CH}_3)_4\text{Cl}$  at 25°.

#### SOLUBILITY OF TETRA METHYL AMMONIUM CHLORIDE IN ETHYLENE DICHLORIDE ( $\text{CH}_2\text{Cl} \cdot \text{CH}_2\text{Cl}$ ) CONTAINING VARIOUS ADDED SALTS AT 25° (Seward, 1934)

It was necessary to remove all traces of moisture from the Ethylene Dichloride since as little as 0.02%  $\text{H}_2\text{O}$  causes the solubility of tetra methyl ammonium chloride to increase two fold. The determinations were made in presence of dry air.

\*Milbauer (1912-13) found that 100 gms. of cold H<sub>2</sub>O dissolve 1.126 gm. tetramethyl ammonium perchlorate (CH<sub>3</sub>)<sub>4</sub>NC1O<sub>4</sub> and 100 gms. alcohol dissolve 0.04 gm. of the salt.

AMMONIUM CHROMATE (NH<sub>4</sub>)<sub>2</sub>CrO<sub>4</sub>

CrO

## SOLUBILITY OF AMMONIUM CHROMATE IN WATER

(Hill, Soth, and Ricci, 1940<sup>a</sup>)

Solutions of the salt lose ammonia when exposed to the air. At 50° it was found that the % (NH<sub>4</sub>)<sub>2</sub>CO<sub>3</sub> in solution, based on a determination of NH<sub>4</sub><sup>+</sup>, was 0.2% low after an hour's exposure of the solution to the open air and about 0.6% low after two hour's exposure. The loss of ammonia from the solid salt was negligible. Each result is the mean of a determination from supersaturation and one from undersaturation.

## SOLUBILITY OF AMMONIUM CHROMATE IN AQUEOUS SOLUTIONS OF AMMONIA AT 15° (Weitz and Stamm, 1925)

The authors give several diagrams and a lengthy discussion of the solubility of ammonium chromate and other ammonium salts (bromide, chloride, chlorate, perchlorate, molybdate, nitrate, oxalate, sulfate, sulfite and dithionate) in aqueous solutions of ammonia. Some of the data are evidently taken from the literature and the rest are based on the experiments of Stamm. Numerical results are not given and the diagrams are not large enough to permit quantitative estimations. They show in general that the solubility of ammonium salts of monovalent acids increase and those of divalent acids decrease with increase of the concentration of ammonia.

50	1.320	48.0	92.3				

Data for equilibrium in the systems  $\text{NH}_4\text{I} + \text{I} + \text{C}_6\text{H}_6$  and  $\text{NH}_4\text{I} + \text{I} + \text{C}_6\text{H}_5\text{CH}_3$  are given by Foote and Bradley, 1933. The results show that no compound with the solvent occurs but only the binary tri iodide,  $\text{NH}_4\text{I}_3$ , which is stable over a wide range of iodine concentrations. Since  $\text{NH}_4\text{I}$  is practically insoluble in benzene and in toluene the authors analytical values are for the percentages of iodine in solution at each invariant point.

Data for the distribution of  $\text{NH}_4\text{I}$  between ethylene glycol and ethyl acetate at 30° are given by Dawson and Griffiths, 1951. Average K (glycol/ester) = 292 (in moles per liter) when the concentration in the glycol is about 0.1M.

100 cc. of sat. sol. in ethyl urethan at 60° contains 9.00 gms.  $\text{NH}_4\text{I}$ . (Stuckgold, 1917)

## SOLUBILITY OF AMMONIUM IODIDE IN LIQUID AMMONIA

(2) Linhard and Stephan, 1933, 1934

(3) Hunt and Boncyk, 1933

100 gms. liquid Sulfur Dioxide ( $\text{SO}_2$ ) dissolve 8.4 gms.  $\text{NH}_4\text{I}$  at  $0^\circ$ .  
(Jander and Wickert, 1936; Jander and Ruppert, 1937)

The phase diagram for the system  $\text{NH}_4\text{I} + \text{I}_2$  was determined by Briggs and Ballard, 1940.

Determinations of the vapor pressure - temperature relations in the system  $\text{NH}_4\text{I} + \text{SO}_2$  are given by Foote and Fleischer, 1931.

<sup>a</sup>Stuckgold, 1917

Very exact determinations of the solubility of tetra methyl ammonium iodide in aqueous solutions of KOH and of  $\text{NH}_4\text{CN}$  at  $25^\circ$  are given by Hill (1917).

Freezing points for mixtures of tetra methyl ammonium iodide and iodine are given by Olivari, 1908.

## THE SYSTEM AMMONIA - MOLYBDIC OXIDE - WATER--Cont.

(Earlier results of Foote and Bradley, 1936, at 25°, differing from those above)

The study of this system is rendered difficult by the slowness with which equilibrium is reached at the molybdenum end of the diagram and the colloidal character and high concentration of the solutions at the other end. The mixtures were prepared from the well crystalline ammonium paramolybdate,  $3(\text{NH}_4)_2\text{MoO}_4 \cdot 4\text{MoO}_3 \cdot 4\text{H}_2\text{O}$ , and either ammonia or  $\text{MoO}_3$ , and rotated for periods of several weeks to several months. Both the saturated solutions and solid phases were analyzed.

The authors call attention to the improbability of the existence at 25° of all of the five ammonium molybdates, mentioned in the literature, which contain a larger proportion of  $\text{MoO}_3$  than present in the above two compounds.

Gms. per 100 gms. sat. sol.		Solid Phase	Gms. per 100 gms. sat. sol.		Solid Phase
$\text{NH}_3$	$\text{MoO}_3$		$\text{NH}_3$	$\text{MoO}_3$

AMMONIUM PHOSPHO MOLYBDATE  $(\text{NH}_4)_3\text{PO}_4 \cdot 14\text{MoO}_3 \cdot 4\text{H}_2\text{O}$ 

SOLUBILITY IN WATER AND AQUEOUS SOLUTIONS AT 15°  
(de Lucchi, 1910)

Solvent	Gms. Salt per 1000 Gms. Solvent
Water	0.238
5 per cent aqueous $\text{NH}_4\text{NO}_3$ solution	0.137
1 per cent aqueous $\text{HNO}_3$ solution	0.203

AMMONIUM TRI NITRIDE  $\text{NH}_4\text{N}_3$ 

N

SOLUBILITY OF AMMONIUM TRINITRIDE IN WATER  
(Frost, Cothran and Browne, 1933)

t°	Gms. $\text{NH}_4\text{N}_3$ per 100 gms. sat. sol.	Solid Phase
0	13.8	$\text{NH}_4\text{N}_3$
20	20.16	"
40	27.07	"

Pressure-temperature-concentration relations in the binary system ammonium tri nitride-ammonia are given by Howard, Jr., Friederichs and Browne, 1934. The solvates, ammonium trinitride diammonate,  $\text{NH}_4\text{N}_3 \cdot 2\text{NH}_3$ , and ammonium trinitride penta ammonate,  $\text{NH}_4\text{N}_3 \cdot 5\text{NH}_3$ , were obtained as white crystalline solids. The diammonate undergoes inversion into ammonous salt at -9° and the pentaammonate undergoes inversion into the diammonate at -71°. The eutectic is located at -87° and 76% ammonia.

## N NITROGEN

### N TRIMETHYL AMMONIUM TRINITRIOE $N(CH_3)_3N_3$

APPROXIMATE SOLUBILITY IN SEVERAL SOLVENTS AT 20°  
(Friedlander, 1918)

	Gms. $N(CH_3)_4N_3$ per 100 gms. sat. sol.		Gms. $N(CH_3)_4N_3$ per 100 gms. sat. sol.
Water	50.0	Benzene	0.4
Ethyl alcohol	5.0	Chloroform	0.1
Methyl alcohol	2.0	Ethyl ether	0.05

Excess of the salt in contact with carbon tetrachloride forms two layers, the lower of which contains 0.5 gm.  $N(CH_3)_4N_3$  per 100 cc.

### NO AMMONIUM NITRITE $NH_4NO_2$

SOLUBILITY OF AMMONIUM NITRITE IN WATER\_  
DETERMINED BY THE FREEZING-POINT METHOD  
(Bureau, 1937)

t°	Gms. $NH_4NO_2$ per 100 gms. sat. sol.	Solid Phase	t°	Gms. $NH_4NO_2$ per 100 gms. sat. sol.	Solid Phase

### NO AMMONIUM NITRATE $NH_4NO_3$

THE SYSTEM AMMONIUM NITRATE - WATER

Although a large number of determinations have been made on this common system, the agreement between authors is only within 1% of the average curve. This is probably caused both by the high solubility and by the existence of several polymorphic forms. The transition between two forms at 32.3° can be observed as a break in the solubility curve, but the other transitions (at -16°, 84°, 125°) cannot.

(Cont.)

## THE SYSTEM AMMONIUM NITRATE - WATER--Cont.

The following results were read from the average curve through the data of Rodenbush, 1918; Early and Lowry, 1919; Millican, Joseph and Lowry, 1922; Kazantzev, 1923, 1925; Mondain Monval, 1923, 1925; Cohen and Bredee, 1925; Schwarz; Muller and Kaufman, 1901-02; de Waal, 1910; Schreinemakers and Haenen, 1910; Hunt, 1932; Kurnakow and Rawitsch, 1933; Nikitina, 1933; Sokolov, 1938; Bergman and Botchkareff, 1937; Bahl and Singh, 1941; Shpunt, 1946; Alexandrov, 1941; Thompson and Vener, 1948; Karnaukhov, 1954; Urazov and Shevtsova, 1957.

### THE SYSTEM AMMONIUM NITRATE - AMMONIUM THIOCYANATE - AMMONIA - WATER (Foote and Brinkley, 1921)

The mixtures were shaken at constant temperatures and the saturated solutions analyzed by titrating the ammonia, using Congo Red as indicator, and the thiocyanate by the Volhard method. The NH<sub>4</sub>NO<sub>3</sub> was estimated by difference.

### THE SYSTEM AMMONIUM NITRATE - AMMONIUM SULFATE - WATER

Most authors report two double salts: 3NH<sub>4</sub>NO<sub>3</sub>·(NH<sub>4</sub>)<sub>2</sub>SO<sub>4</sub> and 2NH<sub>4</sub>NO<sub>3</sub>·(NH<sub>4</sub>)<sub>2</sub>SO<sub>4</sub>, but Jänecke, Eissner, and Brill (1927) found only the 2:1 salt between 0 and 100°.

Results for the system ammonium nitrate - tertiary butyl alcohol - water at 25° are given by Ginnings, Herring and Webb, 1933.

The composition of the homogeneous mixture, plait point, of the three components, as determined by the synthetic method, is 21.6 gms.  $\text{NH}_4\text{NO}_3$  + 33.1 gms. tertiary butyl alcohol  $(\text{CH}_3)_3\text{COH}$ , per 100 gms. sat. solution. The original results for the remaining points on the binodal curve are not given, but only the values corresponding to derived empirical equations for the curve.

The binodal curve for the system ammonium nitrate - allyl alcohol - water at 25° has been determined by Ginnings and Dees, 1935, but the authors do not give their experimental results but only the values of a series of constants calculated from them by means of an empirical equation. From these the conclusion is drawn that allyl alcohol seems to be more difficult to salt out than either iso propyl or normal propyl alcohol. NO

## Solubility in Hydrazine

100 cc. anhydrous hydrazine dissolve 78 gms.  $\text{NH}_4\text{NO}_3$  with decomposition at about 18°. (Welsh and Brodersen, 1915.)

Melting point data are given for the following systems:

$\text{NH}_4\text{NO}_3$ + $\text{AgNO}_3$	(Flavitzkii, 1909; Zawidzki, 1904)
$\text{NH}_4\text{NO}_3$ + $(\text{NH}_4)_2\text{SO}_4$	(Bowen, 1926; Janecke, Eissner and Brill, 1927; Nikonova and Bergman, 1942)
$\text{NH}_4\text{NO}_3$ + $\text{NaCl}$	(Perman, 1922)
$\text{NH}_4\text{NO}_3$ + $\text{NaCl}$ + $\text{NaNO}_3$	(Perman, 1922)
$\text{NH}_4\text{NO}_3$ + $\text{NaNO}_3$	(Perman, 1922; Earley and Lowry, 1922; Campbell and Campbell, 1947; Holmes and Revinson, 1944; Janecke 1949)
$\text{NH}_4\text{NO}_3$ + $\text{Na}_2\text{SO}_4$	(Perman and Harrison, 1924)
$\text{NH}_4\text{NO}_3$ + $\text{Pb}(\text{NO}_3)_2$	(Bogitch, 1915; Campbell and Campbell, 1947)
$\text{NH}_4\text{NO}_3$ + $\text{LiNO}_3$	(Campbell and Campbell, 1947)
$\text{NH}_4\text{NO}_3$ + $\text{LiNO}_3$ + $\text{NaNO}_3$	(Campbell and Campbell, 1947)

## SOLUBILITY IN WATER

The solubility between  $0^\circ$  and  $110^\circ$  was determined by Buchanan and Winner (1920) and by Jänecke (1927) with identical results. The data of Ross, Merz, and Jacob (1929) are considerably higher than these above  $70^\circ$ , and are about 1-2% (absolute) lower below  $40^\circ$ . Between  $0^\circ$  and  $40^\circ$  the solubility has been determined by Bergman and Botchkareff (1938), Shpunt (1941), Belchew and Bergman (1944), Polosin (1946), and Polosin and Shakhparonov, 1947, with fairly good agreement among the various data. The results were plotted, and the average curve drawn through the points was about 1% lower than that of Buchanan and Winner over the same temperature interval. The solubilities of Bergman and Botchkareff are the lowest of all. All investigators except Ross, Merz, and Jacob agree on the solubility at  $0^\circ$ .

Data for the ice curve are included by Bergman and Botchkareff, Belchew and Bergman, Shpunt, Polosin, and Polosin and Ozolin (1940). Those of Shpunt are about  $0.4^\circ$  lower than the others at the same concentrations. These results were also plotted and the eutectic was determined graphically.

- (1) average of Bergman et al., Polosin et al., and Shpunt
- (2) average of Buchanan and Winner, and Jänecke
- (3) average of Ross, Merz, and Jacob

### Results at higher temperatures

(Jänecke, 1936)

The temperatures are those at which the last trace of solid phase disappeared when heating synthetic mixtures.

The author also gives similar determinations for the region of the system in which two liquid layers are formed.

The system  $\text{NH}_4^+, \text{H}^+ || \text{PO}_4^{3-}, \text{NO}_3^- + \text{H}_2\text{O}$  has been extensively studied by Flatt, Brunisholz and Blumer, 1955; Flatt, Brunisholz and Rod, 1955 (both at 25°) and by Flatt, Brunisholz and Denereaz, 1955, at 50°. The results are given on an equivalent % basis and diagrams are drawn for each temperature.

Results for the quinary system  $\text{NH}_4^+, \text{H}^+, \text{Ca}^{++} || \text{PO}_4^{3-}, \text{NO}_3^- + \text{H}_2\text{O}$  at 25° in the region saturated with the double salt  $(\text{NH}_4)_4\text{Ca}_9\text{H}_{32}(\text{PO}_4)_{18} \cdot 10\text{H}_2\text{O}$  are given by Flatt, Brunisholz and Hotz, 1950.

Data for the system  $\text{NH}_4 + \text{P}_2\text{O}_5 + \text{SO}_3 + \text{H}_2\text{O}$  at 25° are given by Berlin and Mautsev, 1933.

Data for the system  $\text{KH}_2\text{PO}_4 - \text{NH}_4\text{H}_2\text{PO}_4 - \text{H}_2\text{O}$  at many temperatures are given by Polosin and Ozolin, 1940.

The author also gives data for the quarternary system  $\text{NH}_3 + \text{K}_2\text{O} + \text{P}_2\text{O}_5 + \text{H}_2\text{O}$  at  $0^\circ$  and at  $25^\circ$ . (Jänecke, 1927.)

Data for the quaternary system  $\text{KCl} + \text{NH}_4\text{H}_2\text{PO}_4 - \text{H}_2\text{O}$  from the eutectic to  $35^\circ$  are reported by Polosin and Shakhparonov, 1940.

THE SYSTEM MONO AMMONIUM HYDROGEN PHOSPHATE - MONOSODIUM HYDROGEN  
PHOSPHATE - WATER  
(Shpunt, 1941)

The eutectic temperature is  $-12.1^\circ$  with the solution containing 8.0%  $\text{NH}_4\text{H}_2\text{PO}_4$  and 26.6%  $\text{NaH}_2\text{PO}_4$ .

### PO AMMONIUM ZINC PHOSPHATE $\text{NH}_4\text{ZnPO}_4$

100 cc. sat. solution of ammonium zinc phosphate in water contain 0.0136 gm.  $\text{NH}_4\text{ZnPO}_4$  at 10.5° and 0.0145 gm. at 17.5°. (Artmann, 1915.)

### EQUILIBRIUM IN THE SYSTEM DIAMMONIUM PHOSPHATE, ISO PROPYL ALCOHOL AND WATER AT 25° (Ginnings and Chen, 1931)

The points on the binodal curve of this system were determined by observing the appearance or disappearance of clouding in a mixture of weighed amounts of the salt and one of the liquids upon addition of weighed amounts of the other. Tie lines, \*, were located by means of determinations of the salt in pairs of liquid layers in contact with each other, and the plait point, PP, was found by plotting.

Gms. per 100 gms. homogeneous mixture		Gms. per 100 gms. homogeneous mixture	
$(\text{NH}_4)_2\text{HPO}_4$	iso $\text{C}_3\text{H}_7\text{OH}$	$(\text{NH}_4)_2\text{HPO}_4$	iso $\text{C}_3\text{H}_7\text{OH}$
3.48	39.20*	17.19	14.11
5.55	32.84	18.10	13.19
9.53	24.80	23.20	8.79
11.8	21.6 PP	27.14	6.18
12.74	20.10	32.84	3.62*
16.48	14.90		

The composition of the homogeneous mixture (plait point) of the system composed of di ammonium phosphate, tertiary butyl alcohol and water at 25° was found by Ginnings, Herring and Webb, 1933, to be 3.8 percent  $(\text{NH}_4)_2\text{HPO}_4$  + 33.8 percent tertiary  $(\text{CH}_3)_3\text{COH}$  + 62.4 percent  $\text{H}_2\text{O}$ . The original results for the remaining points on the binodal curve are not given but only the values of constants calculated by means of empirical equations.

The binodal curve for the system di ammonium phosphate, allyl alcohol and water at 25° was determined by Ginnings and Dees, 1935, but the authors give only the values of constants calculated by means of empirical equations. The conclusion is drawn that allyl alcohol seems to be more difficult to salt out than either normal or iso propyl alcohol.

### THE SYSTEM MONOAMMONIUM HYDROGEN PHOSPHATE - UREA - WATER (Bliidin, 1941a, Polosin and Treshchov, 1953, 1953a)

The latter authors found no compound formation from the eutectic to +40°C.

### ReO AMMONIUM SULFO PERRHENATE $\text{NH}_4\text{ReO}_3\text{S}$

100 gms. sat. solution of ammonium sulfo perrhenate in water contain 58.5 gms.  $\text{NH}_4\text{ReO}_3\text{S}$  at  $20^\circ$ . (Feit, 1931.)

### S AMMONIUM SULFIDE $(\text{NH}_4)_2\text{S}$ $\text{NH}_4\text{HS}$

#### THE SYSTEM AMMONIA - HYDROGEN SULFIDE (Schefflan and McCrosky, 1932; also Scheffer, 1912)

The vapor pressure curve of  $\text{NH}_3 + \text{H}_2\text{S}$  was determined and also the freezing-points of their mixtures. The vapor pressure curve at  $0^\circ$  showed two regions of constant pressure, respectively at 80mm and 837mm. These correspond to the dissociation pressure of the compound  $\text{NH}_4\text{HS}$  and the pressure at which the solid compound is in equilibrium with solution and vapor at  $0^\circ$ . The vapor pressure temperature curve of the three phase system  $\text{NH}_4\text{HS}$  (solid) solution and vapor was determined by two methods. The freezing-points of various mixtures of  $\text{NH}_3 + \text{H}_2\text{S}$  were also determined.

These results show that ammonium sulfide,  $(\text{NH}_4)_2\text{S}$ , is stable only below  $-18^\circ$ . On heating at this temperature it decomposes into solid cryst.  $\text{NH}_4\text{HS}$  and melt.

## THE SYSTEM AMMONIA - SULFUR DIOXIDE - WATER AT 25° (Hill, 1948)

The system was studied in the concentration range where the total pressure was less than one atmosphere. Only slight oxidation to sulfate occurred, and the solid phase was  $(\text{NH}_4)_2\text{SO}_3 \cdot \text{H}_2\text{O}$  throughout. The solubility of ammonium sulfite read from the plot of these data is several percent less than that found by Ishikawa and Murooka above.

Additional results for the system  $\text{NH}_3\text{-SO}_2\text{-H}_2\text{O}$  at 0°, 20°, 30°, 40°, 50° and 60° are given by Terres and Hahn, 1927. Their results differ from these in solutions containing less than 20%  $\text{SO}_2$ .

AMMONIUM SODIUM HYDROGEN SULFITE  $(\text{NH}_4)\text{Na}_2\text{H}(\text{SO}_3)_2\cdot 4\text{H}_2\text{O}$ 

30

100 gms.  $\text{H}_2\text{O}$  dissolve 42.3 gms. salt at  $12.4^\circ$  and 48.5 gms. at  $15^\circ$ . (Schwincker, 1889.)

AMMONIUM PYROSULFITE  $(\text{NH}_4)_2\text{S}_2\text{O}_5$ 

30

100 gms. sat. solution of ammonium pyro sulfite in water contain 71.33 gms.  $(\text{NH}_4)_2\text{S}_2\text{O}_5$  at  $25^\circ$ . (Ishikawa and Hagisawa, 1931.) The authors also give results for the systems  $(\text{NH}_4)_2\text{S}_2\text{O}_5 + (\text{NH}_4)_2\text{SO}_3 + \text{H}_2\text{O}$  and  $(\text{NH}_4)_2\text{S}_2\text{O}_5 + \text{SO}_2 + \text{H}_2\text{O}$  at  $25^\circ$ .

100 gms. liquid sulfur dioxide dissolve 0.048 gm.  $(\text{NH}_4)_2\text{S}_2\text{O}_4$  at  $0^\circ$ : (Jander and Ruppolt, 1937.)

AMMONIUM SULFATE  $(\text{NH}_4)_2\text{SO}_4$ 

30

## SOLUBILITY IN WATER

Average curve from the results of Rodebush, 1918; Sborgi and Bovalini, 1924; Sborgi, Bovalini and Medici, 1924; Sborgi, 1924; Nishizawa, 1920; Britton, 1922; Caven and Mitchell, 1924; Weston, 1922; Ishikawa and Murooka, 1929. Individual determinations by a number of other investigators are usually in good agreement with these results. Data for the solubility of ammonium sulfate at temperatures above  $100^\circ$  were determined by the synthetic method by Benrath, Gjedbo, Schieffers and Wunderlich, 1937.

Equilibrium data in the system NH<sub>3</sub> - SO<sub>2</sub> - H<sub>2</sub>O between 0° and 100° is reported by Terres and Schmidt, 1927. The solubility of (NH<sub>4</sub>)<sub>2</sub>SO<sub>4</sub> in the presence of excess NH<sub>3</sub> and SO<sub>2</sub> was determined. Freeth gives complete data for the quaternary equilibrium in the system (NH<sub>4</sub>)<sub>2</sub>SO<sub>4</sub> + NH<sub>4</sub>ClO<sub>4</sub> + Na<sub>2</sub>SO<sub>4</sub> + NaClO<sub>4</sub> + H<sub>2</sub>O at 25° and at 60°.

Data for the system  $(\text{NH}_4)_2\text{SO}_4 \cdot \text{CdSO}_4 - \text{NH}_3 - \text{H}_2\text{O}$  at 25° are given by Urazov and Kirakosyan, 1953. Three congruently soluble double salts are found:  $[\text{Cd}(\text{NH}_3)_2(\text{H}_2\text{O})_2]\text{SO}_4 \cdot (\text{NH}_4)_2\text{SO}_4$ ,  $[\text{Cd}(\text{NH}_3)_5\text{H}_2\text{O}]\text{SO}_4 \cdot \text{NH}_4)_2\text{SO}_4$ , and  $[\text{Cd}(\text{NH}_3)_4(\text{H}_2\text{O})_2]\text{SO}_4 \cdot (\text{NH}_4)_2\text{SO}_4$ .

## THE SYSTEM AMMONIUM SULFATE - SODIUM SULFATE - WATER

This system has been studied in great detail by Dawson, 1918; Matignon and Meyer, 1917-1918 and Levi, 1924. Levi presents a diagram constructed from all available determinations at that time.

Results of Dawson, 1918

## SOLUBILITY OF AMMONIUM SULFATE IN AQUEOUS ETHANOL SOLUTIONS

Traube and Neuberg, 1897; Bodlander, 1891; Schreinemakers 1897;  
de Bruyn 1900; Linebarger, 1892; Wibaut, 1909 (30°); Schreinemakers and  
de Baat, 1907 (50°).

When ammonium sulfate is added to aqueous solutions of alcohol, it is found that for certain concentrations and temperatures the solutions separate into two liquid layers, the upper of which contains the larger percentage of alcohol.

## Results at 30°

Two liquid layers are formed at concentrations of alcohol between 5.8 and 62%. At a concentration of 62% alcohol the liquid is homogeneous and contains 1.3 gms. (NH<sub>4</sub>)<sub>2</sub>SO<sub>4</sub> per 100 gms. sat. solution. At 90.4% alcohol no (NH<sub>4</sub>)<sub>2</sub>SO<sub>4</sub> is dissolved.

THE SYSTEM AMMONIUM SULFATE - ISO PROPYL ALCOHOL - WATER AT 25°  
(Ginnings and Chen, 1931)

The binodal curve of this system was determined by observing the appearance and disappearance of clouding in a mixture of weighed amounts of the salt and one of the liquids upon addition of weighed amounts of the other. A tie line, \*, was located by determination of the salt in two liquid phases in contact with each other and the plait point, PP, was found by plotting.

The binodal curves of the system ammonium sulfate + allyl alcohol + water at 25° have been determined by Ginnings and Dees, 1935. The authors do not give their original experimental results but only the values of a series of arbitrary constants calculated from them by means of empirical equations. In the case of allyl alcohol it is concluded that this alcohol is more difficult to salt out than either normal or iso propyl alcohol.

### THE SYSTEM AMMONIUM SULFATE - URETHAN - WATER AT 25° (Palitsch, 1928, 1929)

The phase diagram for the system  $(\text{NH}_4)_2\text{SO}_4$  - pyridine - water at 25° is given by Peakin, 1940, but without numerical data. The ammonium sulfate decreases the solubility of pyridine in water to a minimum of about 22% when the saturated solution contains 15% salt. Additional results are shown graphically by Arakawa, Kawaguchi and Kato, 1958, and by Ginnings, Webb and Hinohara, 1933.

Results of Gall, Church and Brown at 15°, 20°

It was found that solutions of the persulfate decomposed upon standing to yield  $\text{H}_2\text{SO}_5$  and  $(\text{NH}_4)_2\text{SO}_4$  and that  $\text{H}_2\text{O}_2$  was then produced. The amount of  $\text{H}_2\text{SO}_5$  and  $\text{H}_2\text{O}_2$  present at varying lengths of time were determined and an extrapolation was then made to zero time in order to find the amount of undecomposed persulfate originally present. The authors present their original data, and the following rounded values read from plots of the data. Densities are also given.

#### SOLUBILITY IN AMMONIA SOLUTIONS AT 19° (Dawihl, 1940)

The solubility of ammonium paratungstate increased with increasing amounts of free ammonia in solution, and also with time. There was no evidence of a constant value having been attained after 14 months contact with the solutions, although the temperature variation ( $\pm 2^\circ$ ) was large enough to make the accuracy of the results  $\pm 0.2\%$  (abs.). Some typical results were as follows: (in gms. satl per 100 gms. Saturated Solution).

Time	% $\text{NH}_3$			
	0	0.94	6.25	12.0
4 days	1.5	1.6	1.5	1.4
4 months	1.1	2.5	6.3	5.7
13 months	1.1	3.2	12.1	13.3

### $\text{N}_2\text{H}$ HYDRAZINE $\text{N}_2\text{H}_4$

#### FREEZING POINTS IN THE SYSTEM HYDRAZINE - WATER

The results of Hill and Sumner, 1951 and Mohr and Audrieth, 1949 are in excellent agreement. The earlier data of Semishin, 1938 differ somewhat. The values below were selected from the many determinations listed by the authors.

## FREEZING POINTS IN THE SYSTEM HYDRAZINE - WATER--Cont.

## NO NITRIC OXIDE NO

### SOLUBILITY IN WATER (Winkler, 1901)

$\beta$  is the Bunsen Absorption Coefficient which shows the volume of gas (reduced to 0° and 760 mm) absorbed by one volume of the liquid when the pressure of the gas less that of the liquid is 760mm.

$\beta'$  is the volume of gas (reduced to 0 and 760mm) which is absorbed by one volume of the liquid when the total pressure is 760 mm.

$q$  is the weight of gas in grams dissolved by 100 gms. of solvent at the indicated temperature and total pressure of 760 mm.

## NO

### SOLUBILITY OF NITRIC OXIDE IN SALT SOLUTIONS

Data for the solubility of nitric oxide in aqueous solutions of FeSO<sub>4</sub>, NiSO<sub>4</sub>, CoSO<sub>4</sub> and MnCl<sub>2</sub> at 20° are given by Usher (1908); Hufner (1907) and Manchot and Zecheulmayer (1906).

The abs. coef.  $\beta$  for NO in sat. sq. NiSO<sub>4</sub> at 20° is 0.0245; for sat. CoSO<sub>4</sub> it is 0.0288 and for sat. aq. MnCl<sub>2</sub> it is 0.0082.

### SOLUBILITY OF NITRIC OXIDE IN METHANOL (Riccoboni, 1941)

The volume of NO absorbed by one volume of methanol was determined at partial pressures of NO ranging from 400 to 1400 mm. At each temperature the volume dissolved was a linear function of the pressure.

Temperature	0°	10°	20°	30°
Ml. NO per ml. CH <sub>3</sub> OH at 1 atm. pressure of NO	0.3635	0.3622	0.3506	0.347

### SOLUBILITY OF NITRIC OXIDE IN ETHANOL (Carius, 1855)

The ethyl alcohol had a density of 0.792 at 20°.

t°	$\beta$	t°	$\beta$
0	0.3161	15	0.2748
5	.2999	20	.2659
10	.2861	25	.2595

### SOLUBILITY OF NITRIC OXIDE IN OTHER ORGANIC SOLVENTS (Klemenc and Spitzer-Neumann, 1929)

$\ell$  = Ostwald coefficient ml gas per ml of solvent, both at the same temperature and pressure.

<u>Benzene</u>		<u>Nitrobenzene</u>		<u>Carbon Tetrachloride</u>	
t°	$\ell$	t°	$\ell$	t°	$\ell$
8.8	0.275	20	0.188	8.8	0.339
14.6	0.284	40	0.190	19.6	0.345
24.6	0.300	60	0.193	34.0	0.375
34.6	0.318	90	0.188		

Data for the Solubility of Nitric Oxide in nitrosyl chloride ( $\text{NOCl}$ ), pentane and in toluene are given by Trantz and Gerwig, 1925.

Results for vapor pressures and the temperature - composition equilibrium in the system  $\text{NO} + \text{NO}_2$  are given by Purcell and Cheesman, 1932.

Data for equilibrium between nitrogen monoxide, dioxide and trioxide, showing the range of existence of  $\text{N}_2\text{O}_3$  in the stoichiometric gas mixture, are given by Abel and Proisl, 1929.

Equilibrium constants for the reaction  $2\text{NO} + \text{O}_2 \rightleftharpoons 2\text{NO}_2$  and the system  $3\text{NO}_2 + \text{H}_2\text{O} \rightleftharpoons 2\text{HNO}_3 + \text{NO}$  at  $0^\circ$  are given by Epstein (1939).

Freezing-point data are given for mixtures of:

Nitric Oxide + Methyl Ether (Baume and Germann, 1914.)  
 " " + Brom benzene (Pascal and Garnier, 1923.)  
 " " + Nitrogen Tetroxide ( $\text{NO}_2$ ) (v. Wittorff, 1904.)

## NITROGEN DIOXIDE $\text{NO}_2$

## NITROGEN TETROXIDE $\text{N}_2\text{O}_4$

## NITROGEN TRIOXIDE $\text{N}_2\text{O}_3$

### SYSTEMS WITH WATER

Results for the temperatures of the freezing-points and the region of separation into two liquid layers in the system  $\text{N}_2\text{O}_3 + \text{H}_2\text{O}$  and the pseudo binary system  $\text{N}_2\text{O}_4 + \text{H}_2\text{O}$  are given by Lowry and Lemon, 1936. Similar results for the formation of two liquid layers in mixtures of nitrogen peroxide and water ( $\text{N}_2\text{O}_4 + \text{H}_2\text{O}$ ) are given by Lowry, Lloyd and Lloyd, 1936.

Results for the solubility of nitrogen tetroxide in aqueous ferrous bromide solutions are given by Thomas, 1896.

5 cc. of  $\text{NO}_2$  dissolve in 1 cc. of  $\text{H}_2\text{SO}_4$  containing 7.2-8.3%  $\text{HNO}_3$  at room temperature. (Kirichenko, 1940).

Freezing points have been determined for the following:

$\text{NO}_2$ + Sulfur Dioxide ( $\text{SO}_2$ )	Terres and Constantinescu, 1934.)
$\text{N}_2\text{O}_4$ + Bromoform ( $\text{CHBr}_3$ )	(Pascal, 1923.)
" + Chloroform ( $\text{CHCl}_3$ )	" "
" + Methyl Iodide ( $\text{CH}_3\text{I}$ )	" "
" + Carbon Tetrachloride ( $\text{CCl}_4$ )	" "
" + Nitro Trichlor Methane ( $\text{CCl}_3\text{NO}_2$ )	" "
" + Brom benzene ( $\text{C}_6\text{H}_5\text{Br}$ )	" "
" + 2,4,6 Tri nitro toluene ( $\text{C}_6\text{H}_2\text{CH}_3(\text{NO}_2)_3$ )	(Pascal, 1923.)
" + o Nitro toluene ( $\text{C}_6\text{H}_4\text{CH}_3\text{NO}_2$ )	(Breithaupt.)
" + Camphor ( $\text{C}_{10}\text{H}_{16}\text{O}$ )	(Pascal, 1923; Pascal and Garnier, 1923.)
" + Diethylether	(Rubin, Sisler and Shechter, 1952)
" + Tetrahydro furan	( " " )
" + Dioxane	( " " )
" + Dichloro diethyl ether	( " " )

Mannheimer, 1956 reports the compositions of two liquid layers in the system  $\text{N}_2\text{O} - \text{H}_2\text{O}$  at  $26^\circ$  to be 96.0 %  $\text{H}_2\text{O}$  in one phase and 0.51 %  $\text{H}_2\text{O}$  in the other

# SOLUBILITY OF NITROUS OXIDE ( $\text{N}_2\text{O}$ ) IN AQUEOUS SOLUTIONS OF ACIDS AT $25^\circ$

The Bunsen Coefficient  $\beta$  is the volume of gas (reduced to  $0^\circ$  and 760 mm pressure) absorbed by one volume of the solvent when the partial pressure of the gas equals 760 mm mercury.

SOLUBILITY OF NITROUS ACID IN WATER AND IN ORGANIC SOLVENTS  
(Kunerth, 1922)

An apparatus similar to that of Mc Daniel (J. Phys. Chem., 15, 587, 1911) was used. The  $N_2O$  was frozen by means of liquid air and ethyl alcohol and all other gases pumped off. The  $N_2O$  sublimed from the frozen gas was dried over  $P_2O_5$ . Its density was found to be 1.968 gms. per liter at standard temp. and pressure. In the present determinations the  $N_2O$  was sat. with the vapor of the solvent before being shaken with the solvent for the solubility determination. Hence it was not necessary to allow for the vapor pressure of the solvent.

Sol- vent	Cc. $N_2O$ dissolved per 1 cc. solvent (both at same temp. and pressure) at:

One liter cyclohexanol (C<sub>6</sub>H<sub>11</sub>OH) dissolve 235.84 cc Nitrous oxide (N<sub>2</sub>O) at 26° and 766mm pressure. Cauquil, 1927.

In Petroleum  $\beta$  = 2.49 at 10°, 2.11 at 20° (Oniewasz and Walfisz, 1887)

The solubility of nitrous oxide in olive and sesame oils from 17 to 37° was determined by Meyer and Gottlieb-Billroth, 1921.

## SOLUBILITY OF NITROUS OXIDE IN HUMAN BLOOD

t°	(ml. N <sub>2</sub> O 0°, 760 mm. per ml. Blood)	
38	0.417	Siebeck (1909)
37.5	.416	Orcutt and SeEVERS (1937)
37.5	.415	Cullen and Cook (1948)

For additional results see Findlay and Creighton, 1910-1922.

Data for the influence of colloids and fine suspensions on the solubility of nitrous oxide in water at 25° are given by Findlay and Creighton (1910), and Findlay and Howell (1914).

## N NITROGEN

Results for solutions of ferric hydroxide, dextrin, arsenious sulfide, starch, gelatin, glycogen, egg albumen, serum albumen, silicic acid and suspensions of charcoal and of silica are given.

Data for the solubility of  $N_2O$  in liquid  $NO_2$  are given by Rocker, 1952.

## Na SODIUM

### SOLUBILITY OF SODIUM IN AMMONIA (Kraus and Lucasse, 1922)

t°	Mol. % Na	t°	Mol. % Na	t°	Mol. % Na	t°	Mol. % Na
-59.7	1.62	-47.5	2.50	-41.7	3.83	-44.4	5.47

Gold	6.03	23.92
"	8.22	23.39
Zinc	30.37	25.38

Phase diagrams for the systems Na + NaCl, Na + NaBr, Na + NaF, and Na + NaI are given by Bredig, Johnson and Smith, 1955.

Cubicciotti (1949) studied the system Na - NaI - NH<sub>3</sub> at -33°. Two liquid layers are formed, and Na + NaI are miscible in all proportions only when the mole fraction of NH<sub>3</sub> is greater than 0.97.

Sienko, 1949 found that the addition of NaI to mixtures of Na + NH<sub>3</sub> increased the miscibility of the compounds.

SODIUM ALUMINATES  $x\text{Na}_2\text{O} \cdot y\text{Al}_2\text{O}_3 \cdot z\text{H}_2\text{O}$

A10

THE SYSTEM  $\text{Na}_2\text{O} - \text{Al}_2\text{O}_3 - \text{H}_2\text{O}$

Sprauer and Pearce, 1940 at 25°

In agreement with the data of Jucatis, 1934, below.

Gms. per 100 gms. Sat. Sol.

$\text{Na}_2\text{O}$	$\text{Al}_2\text{O}_3$	Solid Phase
38.5	0.65	$\text{Na}_2\text{O} \cdot \text{Al}_2\text{O}_3 \cdot 2.5\text{H}_2\text{O} + 3\text{Na}_2\text{O} \cdot \text{Al}_2\text{O}_3 \cdot 6\text{H}_2\text{O}$

20.1	23.4	"
18.6	9.7	$\text{Al}_2\text{O}_3 \cdot 3\text{H}_2\text{O}$

Results of Jucatis, 1934 at 30°

The mixtures were prepared from crystalline  $\text{Al}(\text{OH})_3$ , pure NaOH and  $\text{H}_2\text{O}$ . They were shaken continually for some 3 months. The saturated solutions and moist residues were analyzed and the composition of the solid phase identified by plotting according to the Schreinemaker method. The original results were plotted and the following values read from the curve.

### Results at 35°

(Nelson, 1941)

These results differ from those of Schreinemakers and deBaat at 25°, who found the phases  $\text{Na}_4\text{As}_2\text{O}_5 \cdot 9\text{H}_2\text{O}$  and  $\text{Na}_{10}\text{As}_4\text{O}_{11} \cdot 26\text{H}_2\text{O}$  and did not find  $2\text{Na}_2\text{O} \cdot \text{As}_2\text{O}_3 \cdot 7\text{H}_2\text{O}$  nor  $\text{Na}_2\text{O} \cdot 3\text{As}_2\text{O}_3$ . Nelson points out that Schreinemakers and deBaat's data did not justify assigning the formula  $\text{Na}_4\text{As}_2\text{O}_5 \cdot 9\text{H}_2\text{O}$  and that the  $\text{Na}_{10}\text{As}_4\text{O}_{11} \cdot 26\text{H}_2\text{O}$  is improbable for theoretical reasons.

At 25°, 28.06 gms. sodium metaarsenite dissolve in 100 gms. ethylene glycol.

At 25°, 20.84 gms. sodium metaarsenite dissolve in 100 gms. propylene glycol.

(Palit, 1947)

## AsO SODIUM ARSENATES $x\text{Na}_2\text{O} \cdot y\text{As}_2\text{O}_5 \cdot z\text{H}_2\text{O}$

## THE SYSTEM $\text{Na}_2\text{O} - \text{As}_2\text{O}_5 - \text{H}_2\text{O}$

### Results at 0°

(Rosenhelm and Thon, 1927)

Highly purified  $\text{NaOH}$  and  $\text{As}_2\text{O}_5$  were used for preparing the solutions. Considerable difficulty was experienced in filtering the syrupy arsenic acid solutions which always contained finely divided, almost colloidal particles in suspension. This was accomplished with the aid of porcelain filter discs and suction.

Up to 40 hours was allowed for securing equilibrium.

## AsO DISODIUM HYDROGEN ARSENATE $\text{Na}_2\text{HAsO}_4$

### SOLUBILITY OF DISODIUM ARSENATE IN WATER (Menzel and Hagen, 1937)

The previous results of Rosenheim and Thon, 1927, for this system are considered to be slightly in error due to inaccuracy of the analytical method. Some additional data are given by Rosenheim and Thon, 1927 and by Guerin, 1956.

\*Metastable

A double salt  $(\text{Na}_2\text{AsO}_4 \cdot 11\text{H}_2\text{O})_4 \cdot \text{NaOCl} \cdot \text{NaCl}$  is precipitated from cooling  $\text{Na}_2\text{HAsO}_4 \cdot 7\text{H}_2\text{O}$  (+NaOH) + NaOCl solutions. The solubility in water is 44.46 gms per 100 ml  $\text{H}_2\text{O}$  at  $30^\circ$ .  
(Braak, Larson, Shiflett and Wilson, 1956)

Results for the solubility of  $\text{Na}_2\text{HAsO}_4$  in NaOH or HCl in the presence of  $\text{Al}^{+++}$ ,  $\text{Fe}^{+++}$  and other soil cations are given by Wiklander and Alvelid, 1951.

100 gms. sat. solution of Disodium Arsenate in 93.5 Wt. % Ethyl Alcohol contain 0.02465 gm.  $\text{Na}_2\text{HAsO}_4$  at about  $18^\circ$ , Wohlk, 1934.

100 gms. glycerol dissolve 50 gms. sodium arsenate at  $15.5^\circ$ . (Ossendowski, 1907.)

# Na SODIUM

## B SODIUM BOROHYDRIDE $\text{NaBH}_4$

### SODIUM TRIMETHOXY BOROHYDRIDE $\text{NaBH}(\text{OCH}_3)_3$

SOLUBILITY OF EACH IN VARIOUS SOLVENTS  
(Schlesinger, Brown and Finholt, 1953)

Solvent	t°	gms per 100 gms solvent	
		$\text{NaBH}_4$	$\text{NaBH}(\text{OCH}_3)_3$
Ammonia (liq)	25	104	5.6
Methylamine	20	28	-
Ethylamine	17	21	-
n-propylamine	28	10	-
i-propylamine	28	6	9.0
n-butylamine	28	5	-
Pyridine	0	3	0.4
	75	3.5	3.0
Morpholine	25	0.3	0.3
	75	0.1	2.3
Dioxane	25	insol.	1.6
	75	insol.	4.5

The solubility  $\text{NaBH}_4$  is less than 1 gm per 100 gms solvent in the following solvents: aniline, ethyl and diethyl cellosolve, acetonitrile diethylamine, triethylamine, ethyl acetate, diethyl ether, methyl borate.

## B SODIUM HYDROXY FLUOBORATE $\text{Na}(\text{OH})\text{BF}_3$

The solubility of  $\text{NaOH} \cdot \text{BF}_3$  in ethanol at room temperature is 0.3% (Ryss and Slutskaya, 1952)

## BO SODIUM BORATES $\text{Na}_2\text{O} \cdot y\text{B}_2\text{O}_3$

### THE SYSTEM SODIUM OXIDE - BORIC OXIDE - WATER

1.5.10 =  $\text{Na}_2\text{O} \cdot 0.5\text{B}_2\text{O}_3 \cdot 10\text{H}_2\text{O}$ ; 1.2.10 =  $\text{Na}_2\text{O} \cdot 0.2\text{B}_2\text{O}_3 \cdot 10\text{H}_2\text{O}$ ; 1.1.8 =  $\text{Na}_2\text{O} \cdot \text{B}_2\text{O}_3 \cdot 8\text{H}_2\text{O}$ ; 1.1.4 =  $\text{Na}_2\text{O} \cdot \text{B}_2\text{O}_3 \cdot 4\text{H}_2\text{O}$ ; 1.1.1 =  $\text{Na}_2\text{O} \cdot \text{B}_2\text{O}_3 \cdot \text{H}_2\text{O}$ ; 2.1.1 =  $2\text{Na}_2\text{O} \cdot \text{B}_2\text{O}_3 \cdot \text{H}_2\text{O}$ ; 1.2.5 =  $\text{Na}_2\text{O} \cdot 0.2\text{B}_2\text{O}_3 \cdot 5\text{H}_2\text{O}$

A 3 dimensional diagram of the system  $\text{NaBO}_2 - \text{NaF} - \text{H}_2\text{O}$  from  $70^\circ$  to  $200^\circ \text{ F.}$  is draw by King, 1954

## Na SODIUM

BO SODIUM TETRABORATE  $\text{Na}_2\text{B}_4\text{O}_7$ SOLUBILITY OF SODIUM TETRABORATE IN WATER  
(Blasdale and Slansky, 1939)

(Menzel and Schulz, 1940 - interpolated values given in parentheses)  
(Benrath, 1942 - above  $100^\circ$ )  
(Earlier solution compositions found by Horn and Van Wagener, 1903;  
Sborgi, 1924; Sborgi, Bovalini and Cappellini, 1924. and Menzel, 1927  
agree with these results)

The pentahydrate is metastable over the entire temperature range.  
The stable phase above  $58.5^\circ$  is  $\text{Na}_2\text{B}_4\text{O}_7 \cdot 4\text{H}_2\text{O}$  (Kernite) rather than  
 $\text{Na}_2\text{B}_4\text{O}_7 \cdot 5\text{H}_2\text{O}$  as had been previously supposed. The pentahydrate is  
remarkably stable even at the boiling point, but solutions containing  
the salt which were kept at  $95^\circ$  for five days gradually became less  
concentrated as the tetra hydrate was formed.

Results for the system  $\text{Na}_2\text{B}_4\text{O}_7 + (\text{NH}_4)_2\text{SO}_4 \rightleftharpoons (\text{NH}_4)_2\text{B}_4\text{O}_7 + \text{Na}_2\text{SO}_4$  (+H<sub>2</sub>O) at 25° are given by Sborgi, Bovalini and Cappellini, 1924.

A diagram of the system  $\text{Na}_2\text{B}_4\text{O}_7 - \text{Na}_2\text{SO}_4 - \text{H}_3\text{BO}_3 - \text{H}_2\text{O}$  at 0°, 35° and 90° is drawn by Zdanovskii (1949). The system had been studied earlier by other Russian workers.

## SOLUBILITY OF SODIUM BORATES IN SEVERAL SOLVENTS

Borate	Solvent	t°	Gms. Salt per 100 Gms. Solvent
"Sodium borate"	Alcohol (d = 0.941)	15.5	2.48 (U.S.P. VIII.)
" "	Glycerol	15.5	60.3 (U.S.P. VIII.)
" "	"	80	100 (U.S.P. VIII.)
"Sodium Biborate"	Trichlorethylene	15	0.011 (Wester and Bruins, 1914.)
Sodium Metaborate	Ethylene Glycol	25	6.98 (Palit, 1947)
" "	Propylene Glycol	25	3.36 (Palit, 1947)
$\text{Na}_2\text{B}_4\text{O}_7 \cdot 10\text{H}_2\text{O}$	86.5% glycerol	20	89.0 (Holm, 1921, 1921a, 1922)
"	98.5% "	20	111.0 (Holm, 1921, 1921a, 1922)

Fusion-point data for mixtures of  $\text{NaBO}_2 + \text{NaPO}_3$  and  $\text{NaBO}_2 + \text{Na}_2\text{SiO}_3$  are given by Van Klooster (1910(11)). Results for  $\text{NaBO}_2 + \text{Na}_2\text{CrO}_4$  are given by Bergman and Bartbaronov, 1957b.

Melting points in the systems  $\text{Na}_2\text{B}_4\text{O}_7 + \text{NaCl}$  and  $\text{Na}_2\text{B}_4\text{O}_7 + \text{NaF}$  were determined by Bergman and Nikonova, 1942. King, 1954 also gives data for the  $\text{Na}_2\text{B}_4\text{O}_7 + \text{NaF}$  system. Results for  $\text{Na}_2\text{B}_4\text{O}_7 + \text{Na}_4\text{P}_2\text{O}_7$  are given by Le Chatelier (1894).

## SODIUM BROMIDE NaBr

Br

## SOLUBILITY OF SODIUM BROMIDE IN WATER

The results of Rudorff, 1862; Guthrie, 1875; de Coppet, 1883; Richards and Churchill, 1899; Etard, 1894; Cocheret, 1911; Greenish, 1900; Scott and Frazier, 1927; Scott and Durham, 1930; Nikolaew and Rawitch, 1931; Keevil, 1942 and Ricci, 1934, were plotted and the following values taken from the average curve.

The figures in parentheses are densities of the sat. solutions.

The lower of the two values given for the temperatures above 100° are taken from a curve plotted from the results of Distanow, 1937.

\*NaBr·2H<sub>2</sub>O + NaBr present

The solubility of NaBr and the system NaBr - NH<sub>3</sub> - H<sub>2</sub>O from -80° to +215° have been studied by Distanov 1953. The solubility first increases, then goes through a minimum and then increases again as NH<sub>3</sub> is added.

## THE SYSTEM SODIUM BROMIDE - SODIUM CHLORIDE - WATER (Vlassov and Bergman, 1943; Bergman and Vlassov, 1949)

The salts form continuous dihydrated solid solutions below 0.15° and continuous anhydrous solid solutions above 50.2°. Between these temperatures both series are found. More detailed results at 8-10° are reported by Bakowkij and Polanskij, 1927.

## THE SYSTEM NaBr - NaCl - 6.611 M NaOH AT 35° (Simons, Orlick and Vaughan, 1952)

In 6.6 M NaOH both phases are anhydrous at 35°. Contrary to theoretical calculations, no miscibility gap in the anhydrous solid solutions was observed.

29.5	23.6 PP.		

## THE SYSTEM SODIUM BROMIDE - t-BUTYL ALCOHOL - WATER AT 25° (Ginnings, Herring and Webb, 1933)

The composition of the homogeneous mixture (plait point) at 25° of the system NaBr + Tertiary Butyl Alcohol + H<sub>2</sub>O was found to 11.0 percent NaBr + 36.3 percent ter. (CH<sub>3</sub>)<sub>3</sub>COH + 52.7 percent H<sub>2</sub>O.

The original results for the remaining points on the binodal curve are not given but only the values corresponding to derived empirical equations for the curve.

The effect of the addition of 0.04 - 0.10 molar sodium bromide on the mutual solubility of n-butyl alcohol and water is reported by Reber, McNabb, and Lucasse, 1942.

100 gms. 86.5% glycerol (d = 1.2326) dissolve 44.7 gms. NaBr at 20°. 100 gms. 98.5% glycerol (d = 1.2645) dissolve 38.7 gms. NaBr at 20°. (Holm, 1921, 1922.)

100 gms. 95% formic acid dissolve 22.3 gms. NaBr at 18.5°. (Aschan, 1913.)

100 cc. anhydrous hydrazine dissolve 37 gms. NaBr at room temp.  
(Welsh and Broderson, 1913.)

## SOLUBILITY OF NaBr IN LIQUID SULFUR DIOXIDE

0°	0.016 gms NaBr per 100 gms SO <sub>2</sub>	(Jander and Ruppolt, 1937.)
25°	0.0038 " "	(Shatenstein and Viktorov, 1937)

Melting-point data are given for:

NaBr + NaCl	(Amadori, 1912(a); Ruff and Plate, 1903.)	
NaBr + NaI	(Amadori, 1912a)	
NaBr + NaF	(Ruff and Plate, 1903.)	
NaBr + NaOH	(Scarpa, 1915.)	Br
NaBr + NaNO <sub>2</sub>	(Meneghini, 1912.)	
NaBr + Na <sub>2</sub> SO <sub>4</sub>	(Ruff and Plate, 1903.) (Flood, Forland and Nesland, 1951)	
NaBr + SrBr <sub>2</sub>	(Kellner, 1917.)	
NaBr + Na <sub>2</sub> CO <sub>3</sub>	(Nyankovskaya, 1952.)	
NaBr + PbBr <sub>2</sub>	(Gromakov, 1950)	
NaBr + RbBr	(Gromakov and Gromakova, 1953)	
2NaBr + PbCl <sub>2</sub> ⇌ 2NaCl + PbBr <sub>2</sub>	(Il'yasov, Shchemeleva and Bergman, 1957)	
NaBr + AgNO <sub>3</sub> ⇌ NaNO <sub>3</sub> + AgBr	(Zakharchenko and Bergman, 1956)	
NaBr + TlCl ⇌ NaCl + TlBr	(Il'yasov, Fonardzhyan and Bergman, 1957)	

Reactions of the salts below the melting points were studied with X-rays by Link and Wood (1940) for the following pairs:

SODIUM BROMATE NaBrO<sub>3</sub>

## THE SYSTEM SODIUM BROMATE - SODIUM SULFATE - WATER (Ricci, 1934, 1935)

Na.10 =  $\text{Na}_2\text{SO}_4 \cdot 10\text{H}_2\text{O}$ .

m = Metastable. S.S. = Solid Solutions containing the indicated percentages of  $\text{NaBrO}_3$ .

Similar results are also given for the isotherms 30°, 37.5° and 52°.

This system provides a sixth type of solid solution in addition to the five possible types described by Roozeboom.

SOLUBILITY OF SODIUM ACETATE IN AQUEOUS SOLUTIONS OF ACETIC ACID AT  
VARIOUS TEMPERATURES  
(Dunningham, 1912)

Additional data for 5°, 20°, 45° and 60° are also given.

Similar data for 30° are given by Dukelski (1909), and for 20° by Abe (1911-12). One determination at 25°, expressed in terms of volume of solution, is given by Herz (1911-12). Two determinations at 10° similarly expressed, are given by Enklaar (1901).

The composition of the homogeneous mixture (plait point) of the system Sodium Acetate - Tertiary Butyl Alcohol - Water at 25° was found by Ginnings, Herring and Webb, 1933, to be 4.7 percent  $\text{CH}_3\text{COONa}$  + 38.0 percent  $\frac{1}{2} (\text{CH}_3)_3\text{COH}$  + 57.3 percent  $\text{H}_2\text{O}$ .

The original results for other points on the binodal curve are not given but only the values corresponding, to derived empirical equations for the curve.

The triangular diagram but no numerical values are given by Jencie, 1934, for the system Sodium Acetate + Phenol + Water at 25°.

# Na SODIUM

## SOLUBILITY OF SODIUM ACETATE IN ANHYDROUS SOLVENTS

Solvent	t°	Solubility
Methanol	15	16.0 gms $\text{CH}_3\text{COONa}$ per 100 gms solvent (Henstock, 1934)
Ethanol	25	7.4 gms $\text{CH}_3\text{COONa} \cdot 3\text{H}_2\text{O}$ per 100 gms solvent (Seidell, 1910; Bodtker, 1897)

Data for equilibrium in the system Sodium Acetate + Lead Acetate + Acetic Acid at 30° are given by Griswold and Olson, 1934.

Data for equilibrium in the system Sodium Acetate + Zinc Acetate + Acetic Acid, Determined by the Freezing-point method, are given by Davidson and McAllister, 1930.

Melting points are given for the systems

Sodium acetate - Zinc Acetate	(Lehrman and Skell, 1939)
Sodium acetate - Sodium propionate	(Sokolov, 1954)
Sodium acetate - sodium iso butyrate	(Sokolov, 1954)
Sodium acetate - sodium iso pentanoate	(Sokolov, 1954)
Sodium acetate - sodium benzoate	(Sokolov, 1954)
Sodium acetate - sodium stearate	(Sokolov, 1954)
NaCH <sub>3</sub> COO + KC <sub>2</sub> H <sub>3</sub> COO = NaC <sub>2</sub> H <sub>3</sub> COO + KCH <sub>3</sub> COO (Sokolov and Pochtakova, 1958)	

### SODIUM TRICHLOROACETATE Cl<sub>3</sub>CCOONa

Data for the system sodium trichloroacetate - phenol - water are reported by Schryver, 1910.

## Na SODIUM

### C<sub>6</sub>H SODIUM PHENYLACETATE C<sub>6</sub>H<sub>5</sub>CH<sub>2</sub>COONa

A diagram for the system sodium phenylacetate - phenylacetic acid - water at 25° is given by SMITH, 1953. The solubility of sodium phenyl acetate in water at 25° is 3.9 moles per 1000 gms saturated solution

Melting points are given for the systems:

		(Crawford, 1941)
Sodium phenylacetate + phenylacetic acid	(Bakunin and Vitale, 1935)	
+ phenylacetic anhydride	(Bakunin and Vitale, 1935)	
+ ethyl phenylacetate	(Bakunin and Vitale, 1935)	

### C<sub>3</sub>H SODIUM PROPIONATE C<sub>2</sub>H<sub>5</sub>COONa

The triangular diagram but no numerical values are given by Jencic, 1934, for the system Sodium Propionate + Phenol + Water at 25°.

#### SOLUBILITY IN ORGANIC SOLVENTS

Methanol	15°	13.28 gms C <sub>2</sub> H <sub>5</sub> COONa per 100 gms. solvent	
			(Henstock, 1934)
	68°	13.77 gms C <sub>2</sub> H <sub>5</sub> COONa per 100 gms. solvent	
			(Henstock, 1934)
Ethylene glycol	25	3.221 moles C <sub>2</sub> H <sub>5</sub> COONa per 1000 gms solvent	
			(Palit, 1947)
Propylene glycol	25	2.072 moles C <sub>2</sub> H <sub>5</sub> COONa per 1000 gms solvent	
			(Palit, 1947)

Melting points are given for:

Sodium propionate - Sodium isopropionate	(Sokolov, 1954)
" " - Sodium isobutyrate	( " " )
" " - Sodium pentanoate	( " " )
" " - Sodium benzoate	( " " )
" " - Sodium stearate	( " " )
NaC <sub>2</sub> H <sub>3</sub> COO + LiNO <sub>3</sub> = NaNO <sub>3</sub> + LiC <sub>2</sub> H <sub>3</sub> COO	(Tsindrik and Sokolov, 1958)

### SODIUM ISOPROPIONATE (CH<sub>3</sub>)<sub>2</sub>CHCOONa

Melting points are given for the systems

Na isopropionate - Na isobutyrate	(Sokolov, 1954)
Na " - Na pentanoate	( " " )
Na " - Na stearate	( " " )
Na " - Na Benzoate	( " " )

The composition of the homogeneous mixture (plait point) of the system, Sodium Tartrate - Tertiary Butyl Alcohol - Water at 25° was found by Ginnings, Herring and Webb, 1933, to be 3.8 percent Na<sub>2</sub>C<sub>4</sub>H<sub>4</sub>O<sub>8</sub> + 31.4 percent t(CH<sub>3</sub>)<sub>3</sub>COH + 66.8 percent H<sub>2</sub>O.

## SODIUM POTASSIUM TARTRATE NaKC<sub>4</sub>H<sub>4</sub>O<sub>8</sub>

Results for the plait point in the system Sodium Potassium Tartrate - Tertiary Butyl Alcohol - water at 25° are: 4.0 percent NaKC<sub>4</sub>H<sub>4</sub>O<sub>8</sub> + 31.1 percent t(CH<sub>3</sub>)<sub>3</sub>COH + 64.9 percent H<sub>2</sub>O.

The original results for other points on these binodal curves are not given but only the values corresponding to derived empirical equations for the curves. (Ginnings, Herring and Webb, 1933.)

100 gms. Acetone ((CH<sub>3</sub>)<sub>2</sub>CO) dissolve 6.7 gms. NaKC<sub>4</sub>H<sub>4</sub>O<sub>8</sub> at 15°.  
(Henstock, 1934.)

## SODIUM HYDROXY and PYRO TARTRATES

## SOLUBILITY IN WATER

Salt	Formula	t°	Gms. Salt per 100 Gms. H <sub>2</sub> O
Sodium Neutral Inactive Pyrotartrate	$C_5H_6O_8 \cdot Na_2 \cdot 6H_2O$	20	39.73
" Dextro "	" "	20	41.10
			(Schlossberg, 1900.)
Sodium Dihydroxy Tartrate	$C_4H_4O_8Na_2 \cdot 3H_2O$	0	0.039
			(Fenton, 1898.)

SODIUM FUMARATES; Neutral,  $Na_2C_4H_2O_4$ ; Acid,  $NaC_4H_3O_4$  $C_4H$ 100 gms. H<sub>2</sub>O dissolve 22.83 gms. neutral sodium fumarate at 25°.

100 gms. H<sub>2</sub>O dissolve 6.87 gms. acid sodium fumarate at 25°, 10.74 gms. at 40° 18.15 gms. at 60° and 30.2 gms. at 100°.

(Weiss and Downs, 1923.)

SODIUM MALEATE  $Na_2C_4H_2C_4 \cdot 1/2H_2O$ 

100 gms. H<sub>2</sub>O dissolve 96.06 gms.  $Na_2C_4H_2O_4$  at 25°.

(Weiss and Downs, 1923.)

SODIUM ACID MALEATE  $NaC_4H_3O_4 \cdot 3H_2O$ 

100 gms. H<sub>2</sub>O dissolve 6.73 gms.  $NaC_4H_3O_4$  at 25°, 12.81 gms. at 40°, 31.3 gms. at 60° and 288.0 gms. at 100°.

(Weiss and Downs, 1923.)

SODIUM CACOOYLATE  $(CH_2)_2AsO \cdot ONa$ 

100 gms. H<sub>2</sub>O dissolve about 200 gms. of the salt at 15°-20°.

(Squire and Caines, 1905.)

100 cc. 90% alcohol dissolve about 100 gms. of the salt at 15°-20°.

(Squire and Caines, 1905.)

0.00865	0.00256	0.04012	0.00054	0.08595	0.00026

One liter of  $H_2O$  dissolves 1.5 gms. sodium urate at 37°.

(Bechhold and Ziegler, 1910.)

One liter of serum dissolves 0.025 gm. sodium urate at 37°.

(Bechhold and Ziegler, 1910.)

#### SOLUBILITY OF SODIUM URATE IN AQUEOUS SOLUTIONS OF $KH_2PO_4 + K_2HPO_4$ AT 37° (Jung, 1923)

$p_H$ of aq. phosphate solution	5.0	5.6	6.4	6.6	7.0
Gms. $C_5H_7N_4O_3Na$ per liter of solvent	0.25	0.675	0.93	1.15	1.13

### SODIUM DIETHYL THIOCARBAMATE $(C_2H_5)_2NC:SSNa$

Data for the distribution between  $H_2O$  and  $CCl_4$  at varying pH are given by Bode, 1954

SODIUM CITRATE  $(\text{CH}_3)_2\text{COH}(\text{COONa})_3 \cdot 5\frac{1}{2}\text{H}_2\text{O}$ SOLUBILITY IN AQUEOUS ETHYL ALCOHOL AT 25°  
(Seidell, 1910)

Wt. % $\text{C}_2\text{H}_5\text{OH}$ in Solvent	$d_{25}$ of Sat. Sol.	Gms. $\text{C}_6\text{H}_5\text{O}_7\text{Na}_3 \cdot 5\frac{1}{2}\text{H}_2\text{O}$ per 100 Gms. Sat. Sol.	Wt. % $\text{C}_2\text{H}_5\text{OH}$ in Solvent	$d_{25}$ of Sat. Sol.	Gms. $\text{C}_6\text{H}_5\text{O}_7\text{Na}_3 \cdot 5\frac{1}{2}\text{H}_2\text{O}$ per 100 Gms. Sat. Sol.
0	1.276	48.1	40	0.953	4.5
10	1.190	37.4	50	0.918	1.4
20	1.100	25	60	0.892	0.3
30	1.006	11.8	100	0.789	0

Data for equilibrium in the system sodium hydroxide, citric acid, phosphoric acid and water at 20° are given by Pratolongo (1913). The author fails to describe clearly the terms in which the results are expressed, consequently their exact meaning is not clear.

SODIUM PENTANOATE (VALERATE)  $\text{CH}_3(\text{CH}_2)_3\text{COONa}$  $\text{C}_5\text{H}$ 

Melting points in the systems sodium pentanoate - sodium stearate and sodium pentanoate - sodium benzoate are given by Sokolov, 1954.

SODIUM VALERATE (ISO)  $\text{CH}_3\text{CH}_2\text{CH}(\text{CH}_3)\text{COONa}$ SOLUBILITY OF SODIUM ISO-VALERATE IN GLYCOLS AT 25°  
(Palit, 1947)

	Moles $\text{C}_4\text{H}_9\text{COONa}$ per 1000 gms. Glycol
Ethylene Glycol	2.511
Propylene Glycol	1.742

MONO SODIUM L-GLUTAMATE  $\text{C}_3\text{H}_5(\text{NH}_2)(\text{COOH})\text{COONa}$ 

The "hydration temperature" is -8.5°. The transition from pentahydrate to monohydrate occurs at +0.8° and the solution contains 30.5% of the salt. The solubility of the mono sodium salts in gms per 100 gms  $\text{H}_2\text{O}$  at temperature t° is:

$$\begin{aligned} \log S &= 1.711 + 0.00345 t^\circ && \text{for the l-monohydrate} \\ \text{and } \log S &= 1.199 + 0.00743 t^\circ && \text{for the dl-dihydrate} \end{aligned}$$

(Ogawa and Fujii, 1949)

## Na SODIUM

### $C_6H$ SODIUM CAPROATE $CH_3(CH_2)_4COONa$

The triangular diagram, but no numerical results, for the system Sodium Caproate - Phenol - Water at  $25^\circ$  are given by Jencic, 1934.

### SOLUBILITY OF SODIUM CAPROATE IN GLYCOLS AT $25^\circ$ (Palit, 1947)

	Moles $C_6H_{11}OONa$ per 1000 gms. Glycol
Ethylene Glycol	2.641
Propylene Glycol	1.988

### SODIUM STYPHMATE $C_6HO(OH)_2(NO_2)_3Na$

8.43 gms. (0.035 moles) dissolve in 100 gms. of water at  $30^\circ$ .  
(Dermer and Dermer, 1939).

### SODIUM NITRAMILATE $(C_6H_5N_2O_2)Na$

0.724 gms. (0.00264 moles) dissolve in 100 gms. of water at  $30^\circ$ .  
(Dermer and Dermer, 1939).

### SODIUM GLUCONATE $NaC_6H_{11}O_7$

100 gms. sat. solution of Sodium Gluconate in Water contain 46.1 gms.  $NaC_6H_{11}O_7$  at  $25^\circ$ . (May, Weissberg and Herrick, 1929.)

### SODIUM (LANTHANON) ETHYLENEDIAMINE TETRACETATES $(NCH_2CH_2N)(COO)_4Na \cdot L$

#### SOLUBILITIES IN WATER (Marsh, 1955)

(Results in gms of hydrated salt per liter sat. sol)

SOLUBILITY OF SODIUM - NITRO PHENOLATE IN AQUEOUS ALCOHOL AT 25°  
(Fischer, 1914, 1918)

Saturation was secured by means of constant agitation in a thermo-  
stat. The compound also crystallized with 4  $H_2O$  but in all concentrations  
of alcohol above 15 percent the solid phase was  $C_6H_4(NO_2)ONa \cdot 2H_2O$ .

## SOLUBILITY OF SODIUM PICRATE IN AQUEOUS SOLUTIONS OF ETHYL ALCOHOL (Fischer, 1914, 1918)

At 0° the mixtures were stirred in a vessel which was cooled by melting ice. At 25° the mixtures were constantly agitated in a thermostat. The dissolved picrate was determined either by evaporating and weighing the residue or by a method of titration. The concentration of the aqueous alcohol mixtures was controlled by density determinations.

The solid phase in contact with the saturated solutions was  $C_6H_2(NO_2)_3 \cdot ONa \cdot H_2O$  in all cases.

### THE SYSTEM BENZOIC ACID - SODIUM BENZOATE - WATER AT 14°

The curve representing this system consists of three branches. The first branch corresponds to solutions saturated with benzoic acid. The second represents solutions saturated with the double salt, C<sub>6</sub>H<sub>5</sub>COONa·2C<sub>6</sub>H<sub>5</sub>COOH and the third, solutions saturated with sodium benzoate. At the triple points the solutions have the following composition:

Gms. per 100 gms. sat. sol.		Solid Phase
C <sub>6</sub> H <sub>5</sub> COOH	C <sub>6</sub> H <sub>5</sub> COONa	
1.25	35.3	C <sub>6</sub> H <sub>5</sub> COOH + C <sub>6</sub> H <sub>5</sub> COONa·2C <sub>6</sub> H <sub>5</sub> COOH
1.46	40.4	C <sub>6</sub> H <sub>5</sub> COONa + "

SOLUBILITY OF SODIUM BENZOATE IN AQUEOUS ETHYL ALCOHOL AT 25°

SODIUM CINNAMATE  $\text{C}_6\text{H}_5\text{CH:CHCOONa}$  $\text{C}_9\text{H}$ 100 gms.  $\text{H}_2\text{O}$  dissolve 9.1 gms. sodium cinnamate at 15.20°.

100 cc. 90% alcohol dissolve 0.625 gm. at 15-20°. (Squire and Caines, 1905.)

# Na SODIUM

## C<sub>9</sub>H SODIUM 8-QUINOLINOL-5-SULFONATE C<sub>9</sub>H<sub>6</sub>ONHSO<sub>3</sub>Na

Solubility product constants at 25° were determined by Nasanen and Vusitalo, 1954.

## C<sub>10</sub>H SODIUM GUANYLATE C<sub>10</sub>H<sub>13</sub>N<sub>5</sub>O<sub>7</sub>P

### SOLUBILITY OF SODIUM GUANYLATE IN AQUEOUS SOLUTIONS OF SODIUM ACETATE AND OF SODIUM CHLORIDE AT 20° (Feulgen and Rossenbeck, 1923)

Warm solutions of sodium guanylate were prepared and these cooled until a slight excess of the salt separated. They were then allowed to stand many hours in a thermostat at 20°. The nitrogen in a given volume of the saturated solution was determined and from this the amount of guanylate present was calculated.

Normality of aq. salt solution	Results for aq. CH <sub>3</sub> COONa solutions			Results for aq. NaCl solutions		
	Gms. per 100 cc. solution			Gms. per 100 cc. solution		
	CH <sub>3</sub> COONa	N	Na guanylate	NaCl	N	Na guanylate
0.0 (= H <sub>2</sub> O)	0.0	-	2.89	0.0	-	2.88
0.0625	0.86	0.42	2.45	0.37	0.49	2.85
0.25	3.45	0.315	1.81	1.46	0.29	1.68
1.00	13.81	0.08	0.48	5.85	0.12	0.67
2.00	27.22	0.04	0.20	-	-	-
4.00	54.44	0.020	0.11	23.4	0.035	0.20
		0.025	0.15		0.048	0.28

The results are considered of interest in showing the quantitative limits of the sodium acetate method for the determination of guanylic acid.

# Na SODIUM

## SODIUM ALKYL SULFONATES $\text{RSO}_3\text{Na}$

### SOLUBILITY OF SODIUM ALKYL SULFONATES IN WATER (Reed and Tartar, 1936)

	Compound	Formula	Gms. Compound per 100 gms. H <sub>2</sub> O at:	
			25°	60°
$\text{C}_{10}\text{H}$	Na <u>n</u> Octyl Sulfonate	$\text{NaCH}_3(\text{CH}_2)_6\text{CH}_2\text{SO}_3$	74.40	-
	Na <u>n</u> Decyl "	$\text{NaCH}_3(\text{CH}_2)_8\text{CH}_2\text{SO}_3$	4.55	-
	Na Lauryl "	$\text{NaCH}_3(\text{CH}_2)_{10}\text{CH}_2\text{SO}_3$	0.253	48.0
	Na Myristyl "	$\text{NaCH}_3(\text{CH}_2)_{12}\text{CH}_2\text{SO}_3$	0.041	38.8
	Na Cetyl "	$\text{NaCH}_3(\text{CH}_2)_{14}\text{CH}_2\text{SO}_3$	0.0073	6.49
	Na <u>n</u> Octa decyl "	$\text{NaCH}_3(\text{CH}_2)_{16}\text{CH}_2\text{SO}_3$	0.0010	0.131

The following very careful determinations show that these salts increase in solubility very slowly up to a certain temperature and very sharply beyond this definite critical concentration. This phenomenon is explained in terms of the critical micelle concentration. It was also found by hydration experiments that each salt forms a hydrate containing 3.5 mols. of H<sub>2</sub>O.

The following results are in terms of the grams of salt (designated  $\text{C}_{10}$ ,  $\text{C}_{12}$ , etc.) dissolved per 100 gms. H<sub>2</sub>O, given by Tartar and Wright, 1939.

$\text{C}_{10}$  = Sodium Decyl Sulfonate,  $\text{NaCH}_3(\text{CH}_2)_8\text{CH}_2\text{SO}_3$ .

## C<sub>12</sub>H SODIUM LAURATE C<sub>11</sub>H<sub>23</sub>COONa

### THE SYSTEM SODIUM LAURATE - WATER (McBain, Brock, Vold and Vold, 1938)

The determinations were made by the synthetic method which consists in observing the temperatures at which phase changes occur in systems of known composition. In the following table,  $t^{\circ}_1$ , shows the upper temperature limits of the existence of liquid crystalline soap phases and  $t^{\circ}_2$ , shows the upper temperature limits of the existence of crystalline soap.

$t^{\circ}_1$	$t^{\circ}_2$	Wt. percent Na(CH <sub>3</sub> )(CH <sub>2</sub> ) <sub>10</sub> COOH in sat. sol.	$t^{\circ}_1$	$t^{\circ}_2$	Wt. percent Na(CH <sub>3</sub> )(CH <sub>2</sub> ) <sub>10</sub> COOH in sat. sol.

296	-	89.5
294	-	85.4
290	-	81.3

McBain, Brock, Vold and Vold, 1938, give results for the system sodium laurate - sodium chloride - water at temperatures between 60° and 250°.

Results for the four component system sodium laurate - sodium palmitate - sodium chloride - water at 90°, for two constant ratios of sodium palmitate to sodium laurate, are given by McBain, Vold and Jameson, 1939.

Results for the system lauric acid - sodium hydroxide - water at 25° are given by Bury and Owens, 1936.

Results in the form of a triangular diagram for the system lauric acid - phenol - water at 25° are given by Jencic, 1934.

McBain, Lazarus and Pitten, 1930, give results for the system sodium palmitate + sodium chloride + water, from which the isotherms between 80° and 290° are constructed.

The complete equilibrium diagram of the system sodium palmitate + sodium chloride + water at 90°, has been determined by Vold and Ferguson, 1938, with greater precision than attempted for any other system composed of soap, inorganic electrolyte and water.

Solubility determinations and phase studies in the systems sodium palmitate - trisodium phosphate - water, sodium palmitate - tetrasodium pyrophosphate - water, sodium palmitate - sodium metasilicate - water (and other sodium silicate NaO/SiO<sub>2</sub> ratios) were made by Merrill and Getty, 1947.

100 gms. sat. solution in H<sub>2</sub>O contain 0.2 gm. sodium palmitate, C<sub>18</sub>H  
 100 gms. sat. solution in 5% aq. bile salts contain 1 gm. sodium palmitate.  
 100 gms. sat. solution in 5% aq. bile salts + 1% lecithin contain 2.4 gms. sodium palmitate. (Moore, Wilson and Hutchinson, 1909.)

## EQUILIBRIUM IN THE SYSTEM SODIUM PALMITATE - PALMITIC ACID (McBain and Field, 1933)

C<sub>16</sub>H

The previous determinations upon this system by Donnan and White, 1911, are incomplete and erroneous, resulting from imperfect separation of solid from liquid. The present results establish the existence of definite acid soaps of constant composition. The observed temperature  $t^{\circ}_c$  is that at which the last trace of solid crystal disappears on heating and  $t^{\circ}_1$  is the first temperature at which the homogeneous isotropic liquid becomes turbid or non-homogeneous on cooling.

In the presence of  $K^+$  the solubility is decreased.

## $C_{18}H$ SODIUM STEARATE $CH_3(CH_2)_{16}COONa$

THE SYSTEM SODIUM STEARATE - WATER  
 (McBain, Vold, and Frick, 1940)

$T_i$  is the temperature at which the isotropic soap solution separates an anisotropic liquid crystalline phase upon cooling.

$T_c$  is the temperature at which the last trace of "curd fibre" disappears on slow heating.

SOLUBILITY OF SODIUM STEARATE IN SEVERAL SOLVENTS  
 (Smith and McBain, 1947)

The determinations were made by the sealed tube method.

The temperatures are those at which, on cooling, anisotropic material began to separate from the homogeneous isotropic solution. After cooling the mixtures were studied visually and by microscopic examinations under polarized light and by photo micrography. These observations are reported in detail.

Results for the solubilization of sodium stearate in aqueous solutions of cresol, cyclohexanol, cyclohexylamine, t-butanol, urea, 2-ethylhexanol, 1-octanol, butyl cellosolve and other compounds are given by Merrill, 1950.

Data for the system sodium stearate - cetane are given by Stross and Abrams, 1950, 1951.

Melting points in the systems Na stearate - NaNO<sub>3</sub> and Na stearate - NaSCN are given by Sokolov, 1954.

## SODIUM SALTS OF PHENOLPHTHALEIN

### THE SYSTEM SODIUM OXIDE - PHENOLPHTHALEIN ANHYDRIDE - WATER AT 25° (Bassett and Halton, 1923)

Saturation was secured by constant rotation in a thermostat for 3 days. Both the solutions and the solid phases were analyzed. The compositions of the latter were established by the "rest method."

The crystalline anhydrous disodium salt could be either

C<sub>18</sub>H

Since it is colorless it must be regarded as the diphenolic salt. The two hydrated forms of the disodium salt also have the phenolic structure. For the trisodium salt there is only one possible structure, namely,  $\text{CO}_2\text{Na}\cdot\text{C}_6\text{H}_4\cdot\text{C}(\text{C}_6\text{H}_4\text{ONa})_2\cdot\text{OH}$ , but two mono sodium salts are possible. They are  $\text{CO}_2\text{Na}\cdot\text{C}_6\text{H}_4\cdot\text{C}(\text{C}_6\text{H}_4\text{OH})_2\cdot\text{OH}$

sodium salts, which have been obtained in the present investigation, have the phenolic structure shown by the latter formula.

47.8	-2.9	69.8	63.8	100.0	approx. 362

The freezing points of dilute sodium deoxycholate solutions were determined by Johnston and McBain, 1942.

## SODIUM ROSIN SOAPS

SOLUBILITIES IN WATER  
(Merril and Getty, 1948)

N wood rosin (commonly used in yellow laundry soaps) with an acid number of 162 and saponification number of 184 (average M.W. of sodium soap = 349), and a hydrogenated rosin soap of average M.W. = 343 were used. The temperatures indicate the formation of an isotropic solution.

\* These three metastable points are by Bump, 1932.

† tr. pt.

(1) Occleshaw, 1931.

The effect of the addition of 0.1 - 1.1 molar sodium thiocyanate on the mutual solubility of n-butyl alcohol and water is reported by Reber, McNabb, and Lucasse, 1942.

# Na SODIUM

## SOLUBILITY OF NaSCN IN ORGANIC SOLVENTS (Hughes and Mead, 1929)

The accuracy of these results is questioned by Partington and Winterton, 1934a, who found 20.66 gms. NaCNS per 100 gms.  $C_2H_5OH$  at  $25^\circ$ . They consider that saturation with excess of salt is a more accurate method than observation of the point at which the last crystal in a solution shows sharp or rounded edges.

Results for:

SCN	<u>Methyl Alcohol</u>		<u>Ethyl Alcohol</u>		<u>Acetone*</u>	
	t°	Gms. NaCNS per 100 gms. $CH_3OH$	t°	Gms. NaCNS per 100 gms. $C_2H_5OH$	t°	Gms. NaCNS per 100 gms. $(CH_3)_2CO$
	15.8	35.00	18.8	18.37	18.8	6.85
	24.7	40.04	35.8	19.05	29.2	9.50
	34.6	45.14	52.8	21.05	41.9	14.08
	48.0	50.98	61.8	22.60	51.0	18.61
	52.3	53.54	70.9	24.43	56.0	21.40

\*In the case of Acetone the equimolecular compound  $NaCNS \cdot (CH_3)_2CO$  was formed.

## THE SYSTEM SODIUM THIOCYANATE - SODIUM IODIDE - ALLYL ALCOHOL AT $25^\circ$ (Partington and Winterton, 1934)

Gms. per 100 gms. $CH_2CHCH_2OH$			Gms. per 100 gms. $CH_2CHCH_2OH$

6.81	10.82	"	28.48	0.0	NaI
14.20	8.44	"			

Data for the effect of small quantities of NaSCN on the miscibility temperature of methanol and cyclohexane are given by Eckfeldt and Lucasse, 1943.

93.5 gms. NaCNS dissolve in 100 gms. of ethylenediamine at  $25^\circ$ . (Isbin and Kobe, 1945.)

100 gms. liquid ammonia ( $NH_3$ ) dissolve 205.5 gms. NaSCN at  $25^\circ$ . (Hunt, 1932.)

Melting points are given for

NaSCN +  $NaNO_3$  (Stehlik, 1956)

NaSCN + Na formate; + Na acetate; + Na propionate; + Na butyrate; + Na isobutyrate; + Na valerate; + Na isovalerate; + Na neovalerate; + Na caproate (Sokolov, 1954a)

SOLUBILITY OF SODIUM CARBONATE IN WATER  
(Kobe and Sheehy, 1948)

The authors made a critical survey of all the available data reported for this system, and compared temperature ranges, methods of determination, etc., and plotted the data on a large scale. The accuracy of each set of data was estimated and a smooth curve was drawn through the points. The results below were then read from the curve and their estimated accuracy is 0.4%.

Original results are given by Wells and McAdam, Jr. (1907), Mulder, Lowel (1851), Reich (1891), Eppel (1899), Ketner (1901-2), Greenish and Smith (1901), Osaka (1910-11), de Paepe (1911), Cocheret (1911), Freeth (1922), Seyer and Todd (1929), Mondain-Monval (1922), Hill and Baron (1927), Teeple (1929), Waldeck, Lynn and Hill (1932), Schroeder, Berk and Gabriel (1936), Foote and Vance (1933), and Keevil (1942). For densities see Hager, Kohlrausch, Schiff, Lunge, Wegscheider and Walter (1905), Flottmann (1928).

## THE SYSTEM SODIUM CARBONATE - SODIUM HYDROXIDE - WATER

(Freeth, 1922.) The results of Hostalek, 1956, are in good agreement and are listed in the table following. Itkina, 1949, at 50°; Green and Frattali at 100°; Schroeder, Berk and Gabriel, 1936, above 100°. Additional data at 30° are given by Pischinger and Szaufarski, 1958, from 50°-140° by Prikhodko, 1932.

## THE SYSTEM SODIUM CARBONATE - SODIUM BICARBONATE - WATER--Cont.

Results of Waldeck, Lynn and Hill, 1934 at High Temperatures

The chromium nickel steel bomb which was used differed from that employed for the solubility of sodium carbonate in water up to 348° in that the sampling receptacle was set in from the top instead of on the side.

## THE SYSTEM $\text{Na}_2\text{CO}_3$ - $\text{NaHCO}_3$ - $\text{NaCl}$ - $\text{H}_2\text{O}$ —Cont.

The following additional determinations of this system at  $35^\circ$  are given by Teeple, 1929.

Gms. per 100 gms. $\text{H}_2\text{O}$			Solid Phase
$\text{Na}_2\text{CO}_3$	$\text{NaHCO}_3$	$\text{NaCl}$	
24.8	-	24.0	$\text{Na}_2\text{CO}_3 \cdot \text{H}_2\text{O}$ + $\text{NaCl}$
-	2.0	35.2	$\text{NaHCO}_3$ + "
49.2	0.8	-	$\text{Na}_2\text{CO}_3 \cdot \text{H}_2\text{O}$ + 1:1:2 (trona)
21.8	6.2	-	$\text{NaHCO}_3$ + "
24.7	0.3	24.0	$\text{Na}_2\text{CO}_3 \cdot \text{H}_2\text{O}$ + " + $\text{NaCl}$
4.2	1.8	33.5	$\text{NaHCO}_3$ + " + "

CO

## THE SYSTEM $\text{Na}_2\text{CO}_3$ - $\text{NaHCO}_3$ - $\text{Na}_2\text{SO}_4$ - $\text{H}_2\text{O}$

H =  $\text{NaHCO}_3$

C =  $\text{Na}_2\text{CO}_3 \cdot 10\text{H}_2\text{O}$

S =  $\text{Na}_2\text{SO}_4 \cdot 10\text{H}_2\text{O}$

1:1:2 =  $\text{Na}_2\text{CO}_3 \cdot \text{NaHCO}_3 \cdot 2\text{H}_2\text{O}$

Cl = NaCl      C·1 =  $\text{Na}_2\text{CO}_3 \cdot \text{H}_2\text{O}$       -S =  $\text{Na}_2\text{SO}_4$       D = n  $\text{Na}_2\text{CO}_3 \cdot m \text{Na}_2\text{SO}_4$

A detailed investigation of the five component system  $\text{Na}_2\text{CO}_3 - \text{NaHCO}_3 - \text{Na}_2\text{SO}_4 - \text{NaCl} - \text{H}_2\text{O}$  between  $20^\circ$  and  $60^\circ$  was carried out by Makarov and Sedelnikov, 1940.

Data for the system  $\text{Na}_2\text{CO}_3 - \text{NaHCO}_3 - \text{NaCl} - \text{Na}_2\text{SO}_4 - \text{H}_2\text{O}$  at  $30^\circ$ ,  $45^\circ$ , and  $60^\circ$  have been determined by Sedelnikov, 1945 for solutions which yield  $\text{NaHCO}_3$  upon crystallization.

THE SYSTEM SODIUM CARBONATE - SODIUM CHLORATE - WATER AT  $24.2^\circ$   
(Iljinsky, 1924)

The solutions were actively shaken at constant temperature and the attainment of equilibrium controlled by successive determinations of density and by analyses. The  $\text{Na}_2\text{CO}_3$  was determined by titration with  $0.1 \text{ N HCl}$ . The chlorate, by boiling with excess of Mohr's salt and titrating with chromate (?).

# Na SODIUM

## THE SYSTEM SODIUM CARBONATE - SODIUM SULFATE - WATER

(Caspary, 1924; Makarov and Jakimow, 1933; Dawkins, 1922; Druzhinin, 1938 (DZ); Green and Frattali, 1946; Makarov and Krasinkov, 1956. For data from -5° to +10° see Seshadri and Loba, 1957.)

The compound  $2\text{Na}_2\text{SO}_4 \cdot \text{Na}_2\text{CO}_3$  is similar to glaserite in that it forms limited solid solutions with each of its components.

$\text{SlO} = \text{Na}_2\text{SO}_4 \cdot 10\text{H}_2\text{O}$ ;  $\text{ClO} = \text{Na}_2\text{CO}_3 \cdot 10\text{H}_2\text{O}$ ;  $\text{C7} = \text{Na}_2\text{CO}_3 \cdot 7\text{H}_2\text{O}$ ;  $\text{Cl} = \text{Na}_2\text{CO}_3 \cdot \text{H}_2\text{O}$ ;  $1-2 = \text{Na}_2\text{CO}_3 \cdot 2\text{Na}_2\text{SO}_4$ ;  $\text{SS} = \text{solid solution}$ ; \*metastable.

Data for the system  $\text{Na}_2\text{CO}_3 - \text{UO}_2\text{CO}_3 - \text{H}_2\text{O}$  at  $26^\circ$  are given Blake, et al, 1956. The double salt  $\text{Na}_4\text{UO}_2(\text{CO}_3)_3$  is formed. The solubility of this salt in various salt solutions is given in the table following. Blake's results for the solubility of  $\text{UO}_2\text{CO}_3$  in  $\text{Na}_2\text{CO}_3$  solutions are listed under  $\text{UO}_2\text{CO}_3$ .

## SOLUBILITY OF $\text{Na}_4\text{UO}_2(\text{CO}_3)_3$ IN VARIOUS SALT SOLUTIONS (Blake et al, 1956)

[moles  $\text{Na}_4\text{UO}_2(\text{CO}_3)_3$  per liter]

THE SYSTEM SODIUM CARBONATE - ISO PROPYL ALCOHOL - WATER AT 25°  
(Ginnings and Chen, 1931)

The results which were determined by the titration method locate the binodal curve, a tie line, \*, and the plait point, PP.

Gms. per 100 gms. of the three constituents		Gms. per 100 gms. of the three constituents		
Na <sub>2</sub> CO <sub>3</sub>	iso Propyl Alcohol	Na <sub>2</sub> CO <sub>3</sub>	iso Propyl Alcohol	
0.10	63.5*	11.70	8.96	
0.91	47.6	14.50	5.61	
2.34	35.8	17.33	3.24	
6.54	19.34	19.18	2.15	
6.3	19.9 PP	19.60	1.60*	
9.35	12.8			CO

THE SYSTEM SODIUM CARBONATE - TERTIARY BUTYL ALCOHOL - WATER AT 30°  
(Ginnings and Robbins, 1930)

The points on the binodal curve of this system were determined by observing the appearance or disappearance of clouding in a mixture of weighed amounts of Na<sub>2</sub>CO<sub>3</sub> and one of the liquids upon addition of a weighed amount of the other. Tie lines, \*, were located by determination of Na<sub>2</sub>CO<sub>3</sub> in two liquid phases in contact with each other, and from these the plait point, PP, was found by plotting.

Gms. per 100 gms. of the 3 constituents		Gms. per 100 gms. of the 3 constituents		Gms. per 100 gms. of the 3 constituents	
Na <sub>2</sub> CO <sub>3</sub>	(CH <sub>3</sub> ) <sub>3</sub> COH	Na <sub>2</sub> CO <sub>3</sub>	(CH <sub>3</sub> ) <sub>3</sub> COH	Na <sub>2</sub> CO <sub>3</sub>	(CH <sub>3</sub> ) <sub>3</sub> COH
-	97.0*	3.3	22.4	9.7	6.8
-	70.0*	4.0	19.7	10.4	6.1
-	55.0*	4.5	- *	11.2	5.2
0.7	52.3	4.6	18.1	12.9	4.0
1.0	50.0	5.0	16.6	14.1	3.3
1.3	41.3	5.4	15.3	15.3	3.1
1.8	35.4	6.0	11.9	16.0	2.5
2.0	35.0 PP.	7.2	9.9	18.9	1.5
2.1	30.8	7.7	- *	25.2	0.6*
2.8	26.2	8.0	8.6		

The plait point, PP, of the above system at 25° was found by Ginnings, Herring and Webb, 1933, to have the composition

2.1 gms. Na<sub>2</sub>CO<sub>3</sub> + 32.2 gms. (CH<sub>3</sub>)<sub>3</sub>COH + 35.7 gms. H<sub>2</sub>O.

These authors also give the following composition of the plait point of the system, sodium potassium carbonate + tertiary butyl alcohol + water at 25°.

2.6 gms. NaKCO<sub>3</sub> + 31.6 gms. (CH<sub>3</sub>)<sub>3</sub>COH + 35.8 gms. H<sub>2</sub>O.

The remaining points on the binodal curves for these systems are not given but only the values of a series of arbitrary constants calculated from them by means of empirical equations.

THE SYSTEM Na<sub>2</sub>CO<sub>3</sub> - ALLYL ALCOHOL - WATER AT 20°

100 gms. saturated solution in glycol contain 3.28-3.4 gms. sodium carbonate. (de Coninck, 1905.)

THE SYSTEM SODIUM CARBONATE, PYRIDINE, WATER  
(Limbosch, 1909)

[Additional data in graphic form are given by Timmermans and Lewin, 1953 and by Arakawa, Kawaguchi and Kato, 1958. The binodal curve and plait point of the system sodium carbonate + pyridine + water at 25° has been determined by Ginnings, Webb and Hinohara, 1933, but the authors do not give their experimental results but only the values of a series of arbitrary constants calculated from them by means of empirical equations.]

Very pure materials were used. The boiling-point (cor.) of the pyridine was 115°-115.07°. Increasing amounts of this pyridine were added to aqueous solutions of sodium carbonate contained in glass tubes. After the tubes were sealed they were placed in a bath and the temperature noted at which the liquid mixture passed from a homogeneous to an opalescent condition. During the observation, the contents of the tubes were stirred by means of pieces of iron, moved with the aid of a magnet on the outside of the tube.

#### Data for equilibrium in the quaternary system

at 24.71° are given by Elöd and Acker, 1938. The available results for the ternary systems were used and especial attention given to the determination of the mono variant points of the quaternary system. The results are expressed according to the Jänecke method in terms of gram molecules of H<sub>2</sub>O to dissolve one gm. mol. of salt mixture of determined composition.

## SOLUBILITY OF NaCl IN WATER AT HIGH PRESSURES

Results for the solubility of sodium chloride in water at 30° under pressures up to 4000 bars (metric atmospheres) are given by Adams and Hale, 1931. Measurements of the volume changes at pressures up to 12,000 bars for aqueous sodium chloride solutions ranging from 0 to 25 weight percent concentration, are given by Adams, 1931. Other results for the influence of pressure upon the solubility of sodium chloride in water are given by v. Stackelberg, 1896; Cohen, Inouye and Buwen, 1910, and by Sill, 1916.

## SOLUBILITY OF NaCl IN STEAM

(Styrikovich, Khaibullin and Tskhvirashvili, 1955)

Additional data, especially in the critical region are given by Copeland, Silverman and Benson, 1953; Ölander and Liander, 1950; Schröer, 1927; Styrikovich, 1950; Aleinikov, Kostrinkin, Novi and Taratuta, 1956.

				100	100	30.56	5.811

<sup>a</sup>(Taylor, Gaby and Eyring, 1933)

For the solvent HDO the authors give W = 33.24, M = 5.978

The change in solubility of NaCl with particle size in the range .07 - .3 mm. was studied by Jones, Burgess and Amis, 1955. Increases of the order of 6 - 12% were observed.

#### SOLUBILITY OF SODIUM CHLORIDE IN AQUEOUS SOLUTIONS OF HYDROGEN PEROXIDE

Floyd and Gross, 1955 present the results of their determinations and those of previous authors graphically. All the results lie on a single smooth curve; the values at 0, 15 and 25° are indistinguishable.

## Results at 30°

Results at 30° in air and in the presence of 1 atm. HCl are given by Sakai, Seiyama and Ikari, 1950, 1950a, 1951, and Sakai and Seiyama, 1953.

Data for equilibrium in the system sodium chloride-arsenic trioxide-water, at 30°, are given by Schreinemakers and deBaat (1915).

The system  $\text{NaCl} - \text{H}_2\text{BO}_3 - \text{H}_2\text{O}$  from -20° to +75° was reviewed by Palkin and Goloshchapov, 1949. The eutectic occurs at -21.4° with 22.9% NaCl, 1.45%  $\text{HCO}_3$ .

C1 Data for the solubility of NaCl in water saturated with  $\text{CO}_2$  from 30° to 70° and from 10 to 70 atm. pressure is given by Utida, 1940.

## SOLUBILITY OF SODIUM CHLORIDE IN AQUEOUS SOLUTIONS OF SODIUM HYDROXIDE AT VARIOUS TEMPERATURES (von Antropoff, 1924)

Constant agitation was employed and equilibrium was approached from above and from below. Silver lined apparatus was used and the determinations were made with the greatest care. The results for 16 isotherms were plotted and the dissolved sodium chloride, and specific gravities of the solutions corresponding to regular intervals of concentration of sodium hydroxide, were read from the curves. The figures in parentheses are the specific gravities of the saturated solutions.

Phase equilibria at high temperatures in the system  $\text{NaCl} - \text{NaOH} - \text{H}_2\text{O}$  are given by Ravich, Borovaya, Luk'yanova and Elenevskaya, 1954.

Data for the mutual solubility of  $\text{NaCl} + \text{NaOH}$  in steam are given by Spillner, 1940.

SOLUBILITY OF SODIUM CHLORIDE IN AQUEOUS AMMONIA AT 30°

Cl

Equations representing the solubility of  $\text{NaCl}$  in aq.  $\text{NH}_3$  are discussed by Nenno, 1954.

Data for the solubility of sodium chloride and of sodium chloride penta-ammoniate, in mixtures of ammonia and water at temperatures between  $-40^\circ$  and  $+25^\circ$  are given by Guyer, Bieler and Schmid, 1934. The present paper, however, contains only the diagrams drawn from the experimental results published in the dissertation of Z. Schmid E.T.H. Zurich, 1934.

The system  $\text{NaCl} - \text{NH}_4 - \text{H}_2\text{O}$  was studied by Distanov, 1953 from  $-78$  to  $+165^\circ$ .

The solubility of  $\text{NaCl}$  in  $\text{NH}_3$  and  $\text{NH}_3 + \text{CO}_2$  solutions at  $35^\circ$  and  $60^\circ$  is reported by Nenno and Drozin, 1955.

Cl

THE SYSTEM SODIUM CHLORIDE - SODIUM DICHROMATE - WATER

Results of Robertson, 1924

The mixtures of salts were dissolved in water at a temperature higher than that of the experiment and the flasks then placed in a thermostat. Constant agitation is not mentioned.

## SYSTEM SODIUM CHLORIDE, SODIUM NITRATE, SODIUM SULFATE AND WATER

(Chretien, 1926, 1927, 1929; See also Guillier, 1927 and Pfeiffenberger and Leimbach, 1928)

The author gives in this very exhaustive paper the complete numerical and diagrammatical results (with densities) for binary, ternary and quaternary equilibrium in this system at very frequent temperature intervals between  $-24.4^{\circ}$  and  $+121.7^{\circ}$ . The following are the values given for the quaternary equilibrium at  $25^{\circ}$ .

d. of sat. sol.	Gms. per 100 gms. sat. sol.			Solid Phase	
	NaNO <sub>3</sub>	NaCl	Na <sub>2</sub> SO <sub>4</sub>		
1.281	7.08	9.98	14.9	Na <sub>2</sub> SO <sub>4</sub> +Na <sub>2</sub> SO <sub>4</sub> ·10H <sub>2</sub> O	Cl
-	12.40	6.42	15.0	" + "	
1.325	18.50	3.15	15.0	" + "	
1.291	11.7	18.6	5.34	" +NaCl	
1.322	18.2	16.6	4.50	" + " +D	
1.319	20.0	13.0	5.92	" +D	
1.325	22.0	8.68	8.19	" +"	
1.333	23.9	4.32	10.8	" +"	
-	22.6	15.3	3.30	NaCl +"	
1.357	26.5	14.0	2.45	" +"	
1.378	31.2	12.7	1.88	" +"+NaNO <sub>3</sub>	
1.387	37.7	6.41	2.51	NaNO <sub>3</sub> +D	
1.396	41.0	3.43	2.8	" +"	

D = Darapskite, NaNO<sub>3</sub>·Na<sub>2</sub>SO<sub>4</sub>·H<sub>2</sub>O.

Solubility studies made over a period of some ten years by many investigators including Cornec and his students have established the diagrams representing the equilibrium in aqueous solutions of the chloride, nitrate and sulfate of sodium at various temperatures. Using these results Graziadei, 1935, 1936, has worked out a graphic method of calculating the yield of nitrate obtained by cooling solutions of two and three salts. A simple formula of practical application has been deduced.

Data for the system  $2\text{NaCl} + \text{Ba}(\text{NO}_3)_2 \rightleftharpoons 2\text{NaNO}_3 + \text{BaCl}_2 + (\text{H}_2\text{O})$  at  $0^{\circ}$  and  $50^{\circ}$  are given by Speranskaya, 1954.

## THE SYSTEM SODIUM CHLORIDE - SODIUM PHOSPHATE - WATER

(Obukhoff and Michailova, 1935)

## THE SYSTEM SODIUM CHLORIDE - PLATINUM CHLORIDE - WATER (Kurnakov and Nikitina, 1940)

Data for the system NaCl - PtCl<sub>4</sub> - H<sub>2</sub>O at 25° are given by Kumakov and Genke, 1924, and the general nature of the system is similar to that indicated below. The freezing points of some mixtures in the system were determined by Kurnakov and Ravich, 1932.

0	31.80	12	30.86
4	32.26	16	30.45
8	31.85	20	30.10

Data for the solubility of NaCl in aqueous  $\text{MgCl}_2$  solutions are given by Feit and Przibylla (1909).

SOLUBILITY OF SODIUM CHLORIDE IN AMMONIUM NITRATE SOLUTIONS  
(Rengade, 1917, 1922)

Equimolecular mixtures of  $\text{NH}_4\text{NO}_3 + \text{NaCl}$  or of  $\text{NaNO}_3 + \text{NH}_4\text{Cl}$  were evaporated at gradually increasing temperatures and the solutions analyzed after the separation of  $\text{NaCl}$  and before the appearance of  $\text{NH}_4\text{Cl}$ , which could be easily distinguished by its crystalline form. The four ions were determined and the results arbitrarily expressed in terms of  $\text{NH}_4\text{NO}_3 + \text{NaCl}$ .

t°	Gms. per 100 gms. H <sub>2</sub> O		t°	Gms. per 100 gms. H <sub>2</sub> O		t°	Gms. per 100 gms. H <sub>2</sub> O		NaNO <sub>3</sub>	Cl
	NH <sub>4</sub> NO <sub>3</sub>	NaCl		NH <sub>4</sub> NO <sub>3</sub>	NaCl		NH <sub>4</sub> NO <sub>3</sub>	NaCl		
80*	81	46	108*	435	100	118	750	140	0	
98*	128	56	111	464	101	124	2,015	320	35	
100*	139	59	115	683	137	129	3,500	427	29	

\*These solutions prepared from equimolecular mixtures of  $\text{NaNO}_3 + \text{NH}_4\text{Cl}$ , and the others from equimolecular mixtures of  $\text{NH}_4\text{NO}_3 + \text{NaCl}$ . The results were intended for use in the industrial preparation of  $\text{NH}_4\text{NO}_3$ .

The specific volumes and heat capacities of solutions of  $\text{NaCl}$  in aqueous ammonium nitrate were determined by Rutskov, 1948.

SOLUBILITY OF SODIUM CHLORIDE IN AQUEOUS SOLUTIONS SIMULTANEOUSLY  
SATURATED WITH OTHER SALTS

The various papers of J. H. van't Hoff and collaborators on this subject were collected by H. Precht and E. Cohn in a volume entitled "Untersuchungen über die Bildungsverhältnisse der Ozeanischen Salzablagerungen," Leipzig, 1912, p. 374. By far the larger part of the "new" data in these papers is for solutions simultaneously saturated with three or more salts. The various systems are described in detail and diagrams are given. A table summarizing much of the data (van't Hoff (1905)) is given below.

Mols. per 1000 Mols. H <sub>2</sub> O					Solution Saturated with Respect to NaCl and:
Na <sub>2</sub> Cl <sub>2</sub>	K <sub>2</sub> Cl <sub>2</sub>	MgCl <sub>2</sub>	MgSO <sub>4</sub>	Na <sub>2</sub> SO <sub>4</sub>	
1	0.5	105	-	-	MgCl <sub>2</sub> ·6H <sub>2</sub> O + Carnallite
2	5.5	70.5	-	-	KCl + Carnallite
44	20	-	-	4.5	" + Glaserite
44	10.5	-	-	14.5	Na <sub>2</sub> SO <sub>4</sub> + Glaserite
46	-	-	16.5	3.0	" + Astrakanite
26	-	7	34	-	MgSO <sub>4</sub> ·7H <sub>2</sub> O + Astrakanite
4	-	67.5	12	-	" + MgSO <sub>4</sub> ·6H <sub>2</sub> O
2.5	-	79	9.5	-	Kieserite + "
1	-	101	5	-	" + MgCl <sub>2</sub> ·6H <sub>2</sub> O
23	14	21.5	14	-	KCl + Glaserite + Schönite
19.5	14.5	25.5	14.5	-	" + Leonite + Schönite
9.5	9.5	47	14.5	-	" + " + Kainite
2.5	6	68	5	-	" + Carnallite + Kainite

Carnallite =  $\text{KMgCl}_3 \cdot 6\text{H}_2\text{O}$ , Glaserite =  $\text{K}_3\text{Na}(\text{SO}_4)_2$ , Astrakanite =  $\text{Na}_2\text{Mg}(\text{SO}_4)_2 \cdot 4\text{H}_2\text{O}$ , Kieserite =  $\text{MgSO}_4 \cdot \text{H}_2\text{O}$ , Leonite =  $\text{MgK}_2(\text{SO}_4)_2 \cdot 4\text{H}_2\text{O}$ , Schönite =  $\text{MgK}_2(\text{SO}_4)_2 \cdot 6\text{H}_2\text{O}$ , Kainite =  $\text{MgSO}_4 \cdot \text{KCl} \cdot 3\text{H}_2\text{O}$ .

\*Quad. pt.

The effect of temperature upon the equilibrium in the above system was greater than observed in any of the other systems investigated and additional data, illustrating the extent of the temperature influence, are given.

SOLUBILITY OF SODIUM CHLORIDE IN AQUEOUS PROPYL ALCOHOL  
(Armstrong and Eyre, 1910-11)

Aqueous propyl alcohol containing 15.01 gms.  $C_3H_7OH$  per 1000 cc.  $H_2O$  dissolves 25.71 gms. NaCl per 100 gms. sat. solution at 0° and 25.95 gms. at 25°.

Aqueous propyl alcohol containing 30.02 gms.  $C_3H_7OH$  per 1000 cc.  $H_2O$  dissolves 25.12 gms. NaCl per 100 gms. sat. solution at 0° and 25.37 gms. at 25°.

100 gms. sat. sol. of NaCl in 99.6 per cent  $C_3H_7OH$  contain 0.04 gm. NaCl at 25°. (Frankforter and Frary, 1913)

# Na SODIUM

## THE SYSTEM SODIUM CHLORIDE - ISO PROPYL ALCOHOL - WATER AT 25° (Ginninge and Chen, 1931)

Points on the binodal curve of this system were determined by observing the appearance or disappearance of clouding in a mixture of weighed amounts of NaCl and one of the liquids, upon addition of weighed amounts of the other. Tie lines, \*, were located by determination of NaCl in two liquid layers in contact with each other and the plait point, PP, was found by plotting.

## THE SYSTEM SODIUM CHLORIDE - ALLYL ALCOHOL - WATER AT 20°--Cont.

The binodal curve for the System Sodium Chloride, Allyl Alcohol and Water at 25° has been determined by Ginnings and Dees, 1935, but the authors do not give their experimental results but only the values of a series of arbitrary constants calculated by means of an empirical equation. From these the conclusion is drawn that allyl alcohol seems to be more difficult to salt out than either normal or iso propyl alcohol.

The effect of the addition of 0.02-0.08 molar sodium chloride on the mutual solubility of n-butyl alcohol and water is reported by Reber, McNabb, and Lucasse, 1942.

THE SYSTEM NaCl - ISOBUTANOL - WATER AT 25°  
(Fritzschke and Stockton, 1946)

SOLUBILITY OF DEXTROSE (GLUCOSE) SODIUM CHLORIDE IN  
HYDROCHLORIC ACID SOLUTIONS AT 30°  
(Ough and Peckham, 1946)

The solubility of the double salt in pure water was found to be 61.4 gms. (C<sub>6</sub>H<sub>12</sub>O<sub>6</sub>)<sub>2</sub> · NaCl per 100 gms. sat. sol. at 30° (compare with above).

Mixtures of the pure double salt, water, and concentrated hydrochloric acid were weighed into flasks which were held at 30° for 1/2 hour with intermittent shaking. The solutions and wet residues were analyzed for NaCl, dextrose, and HCl, and the solid was identified under the microscope.

SOLUBILITY OF SODIUM CHLORIDE IN LIQUID AMMONIA  
(Patscheke, 1933)

The authors results were plotted and the following values taken from the curve. The results of Johnson and Kromboltz, 1933; Scherer, Jr., 1931; Abe and Hara, 1933; Abe, Sigatomi, and Hara, 1935; Schattenstein and Viktorov, 1936; Linhard and Stephan, 1933, 1934; and Portinow and Rawdine, 1937, agree in general with those of Patscheke. The results of Hunt, 1932, at 25° are apparently too low.

## SOLUBILITY OF SODIUM CHLORIDE IN LIQUID AMMONIA--Cont.

Data for the isotherms of the System  $\text{NaCl} + \text{NH}_4\text{Cl} + \text{NH}_3$  at  $-10^\circ$ ,  $0^\circ$  and  $+10^\circ$  are given by Patscheke and Tanne, 1935. They also give results for the solution temperatures of mixtures in various ratios of  $\text{NaCl}$  and  $\text{NH}_4\text{Cl}$  as compared with the solution temperature of each salt separately.

## THE SYSTEM SODIUM CHLORIDE - SODIUM NITRATE - LIQUID AMMONIA

### Results at $0^\circ$

(Portnow and Rawdine, 1937)

Cl	Gms. per 100 gms. sat. sol.			Solid Phase	Gms. per 100 gms. sat. sol.			Solid Phase
	NaCl	$\text{NaNO}_3$	$\text{NH}_3$		NaCl	$\text{NaNO}_3$	$\text{NH}_3$

	6.79	21.96	21.25	"	0.83	55.12	44.05	"
	6.43	22.80	20.77	"	0.0	56.04	43.95	"

### Results at $25^\circ$

(Hunt and Boncyk, 1933)

0.25 gm. of the less soluble salt was mixed with variable amounts of the more soluble salt and ammonia added in excess. Ammonia was then allowed to escape from the solution until a single crystal of salt separated from solution. Identical results were obtained by approaching the saturation point from opposite sides.

For data on the cryoscopy of various salts and oxides in molten NaCl see Harrison, 1955, 1955a; Harrison, Petit and Plancel, 1955; and Petit and Bourlange, 1953.

Reactions of the salts below the melting points were studied with X-rays by Link and Wood, 1940 for the following salt pairs:

NaCl+KF

NaCl+RbF

NaCl+CsF

### ClO SODIUM CHLORATE $\text{NaClO}_3$

#### SOLUBILITY IN WATER

Values read from the average curve drawn through the very closely agreeing results of LeBlanc and Schmandt, 1911; Osaka, 1903-8; Bell, 1923; Ricci and Weltman, 1942; Ricci and Yanick, 1937; Nallet, 1955. The older values of Carlson, 1910 are too high. Other results are given by Billiter, 1920. The values below lie on a straight line. The solid phase is  $\text{NaClO}_3$  in all cases; values in parentheses are densities.
